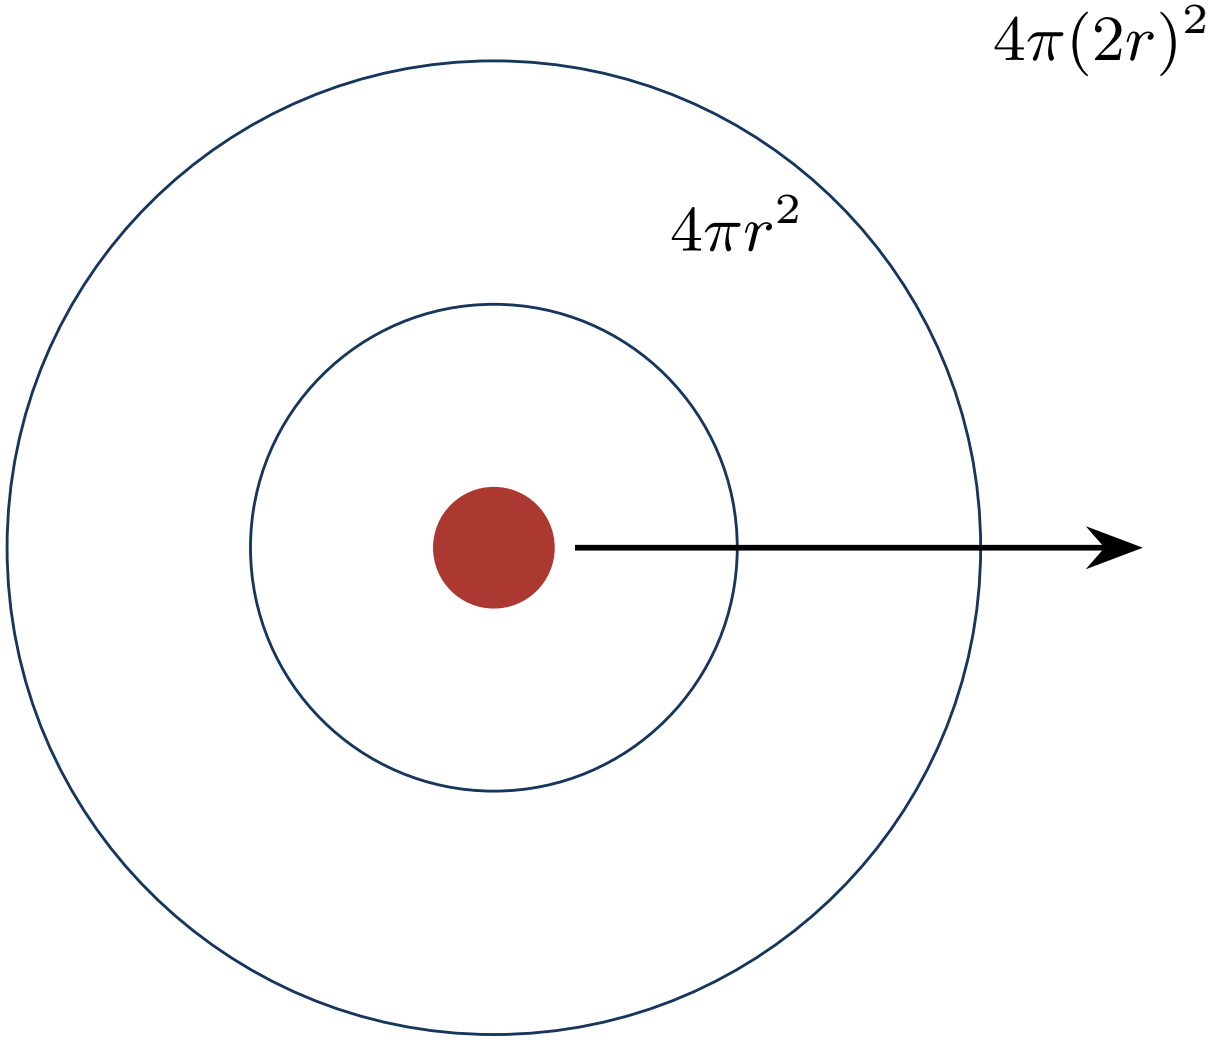
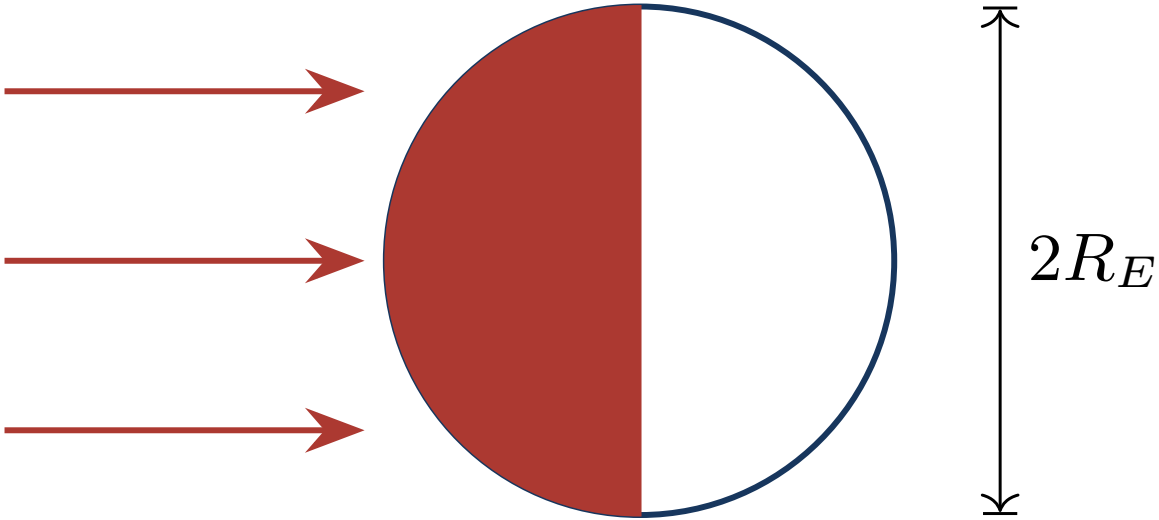
$r$
$F_S = \sigma T_S^4 (r_S/r)^2$
太阳 $r_S, T_S$
地球 $R_E, T_E$

总光度 $L_S$ 不变

$F(2r) = F(r)/4$



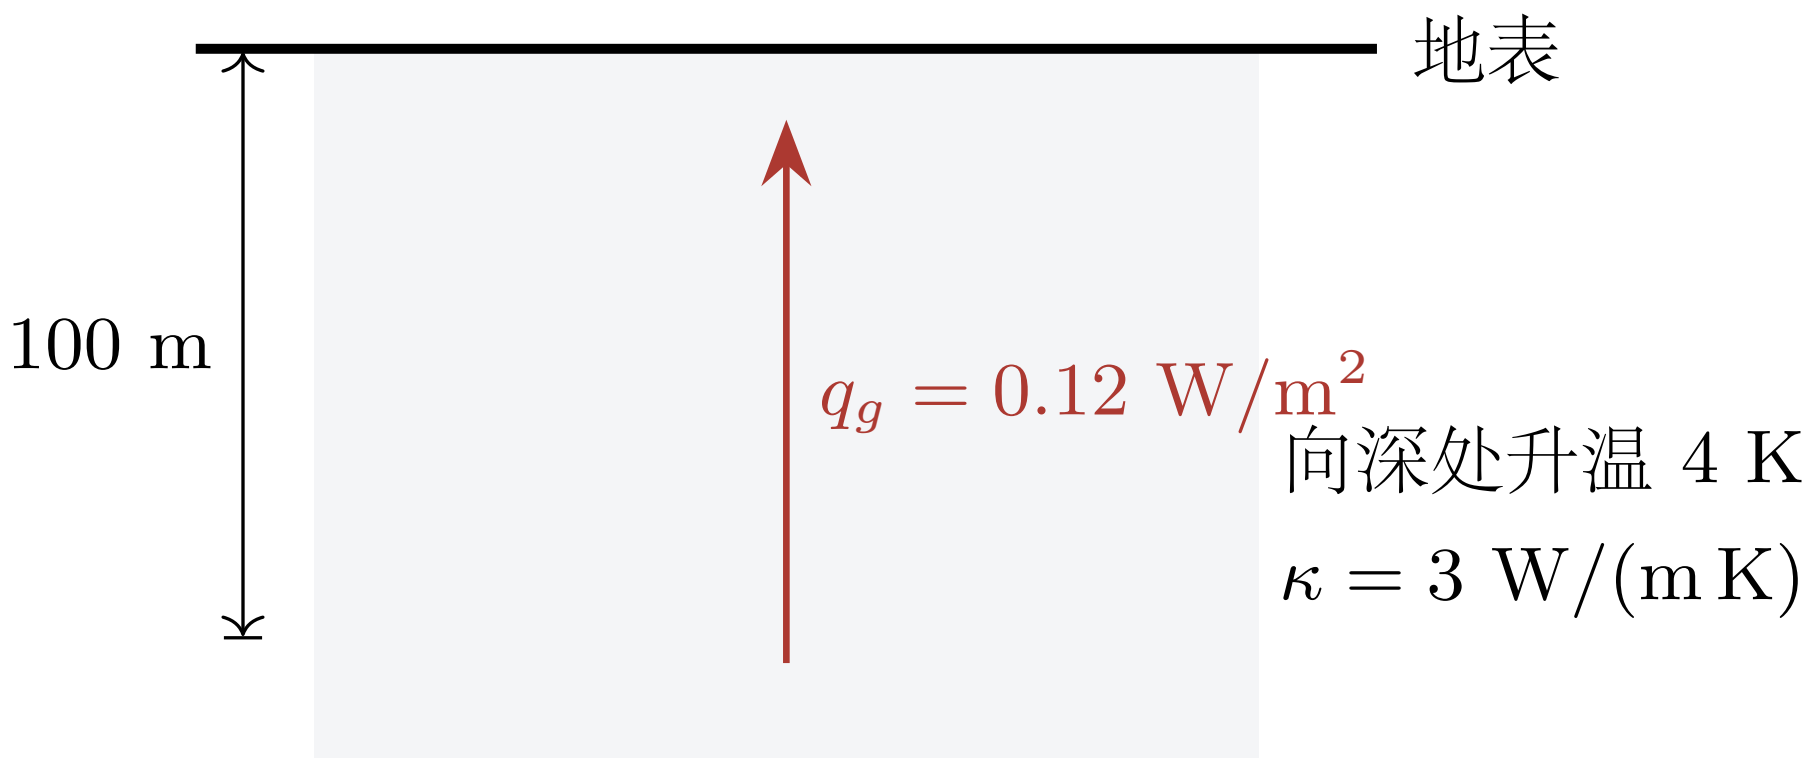


全表面发射

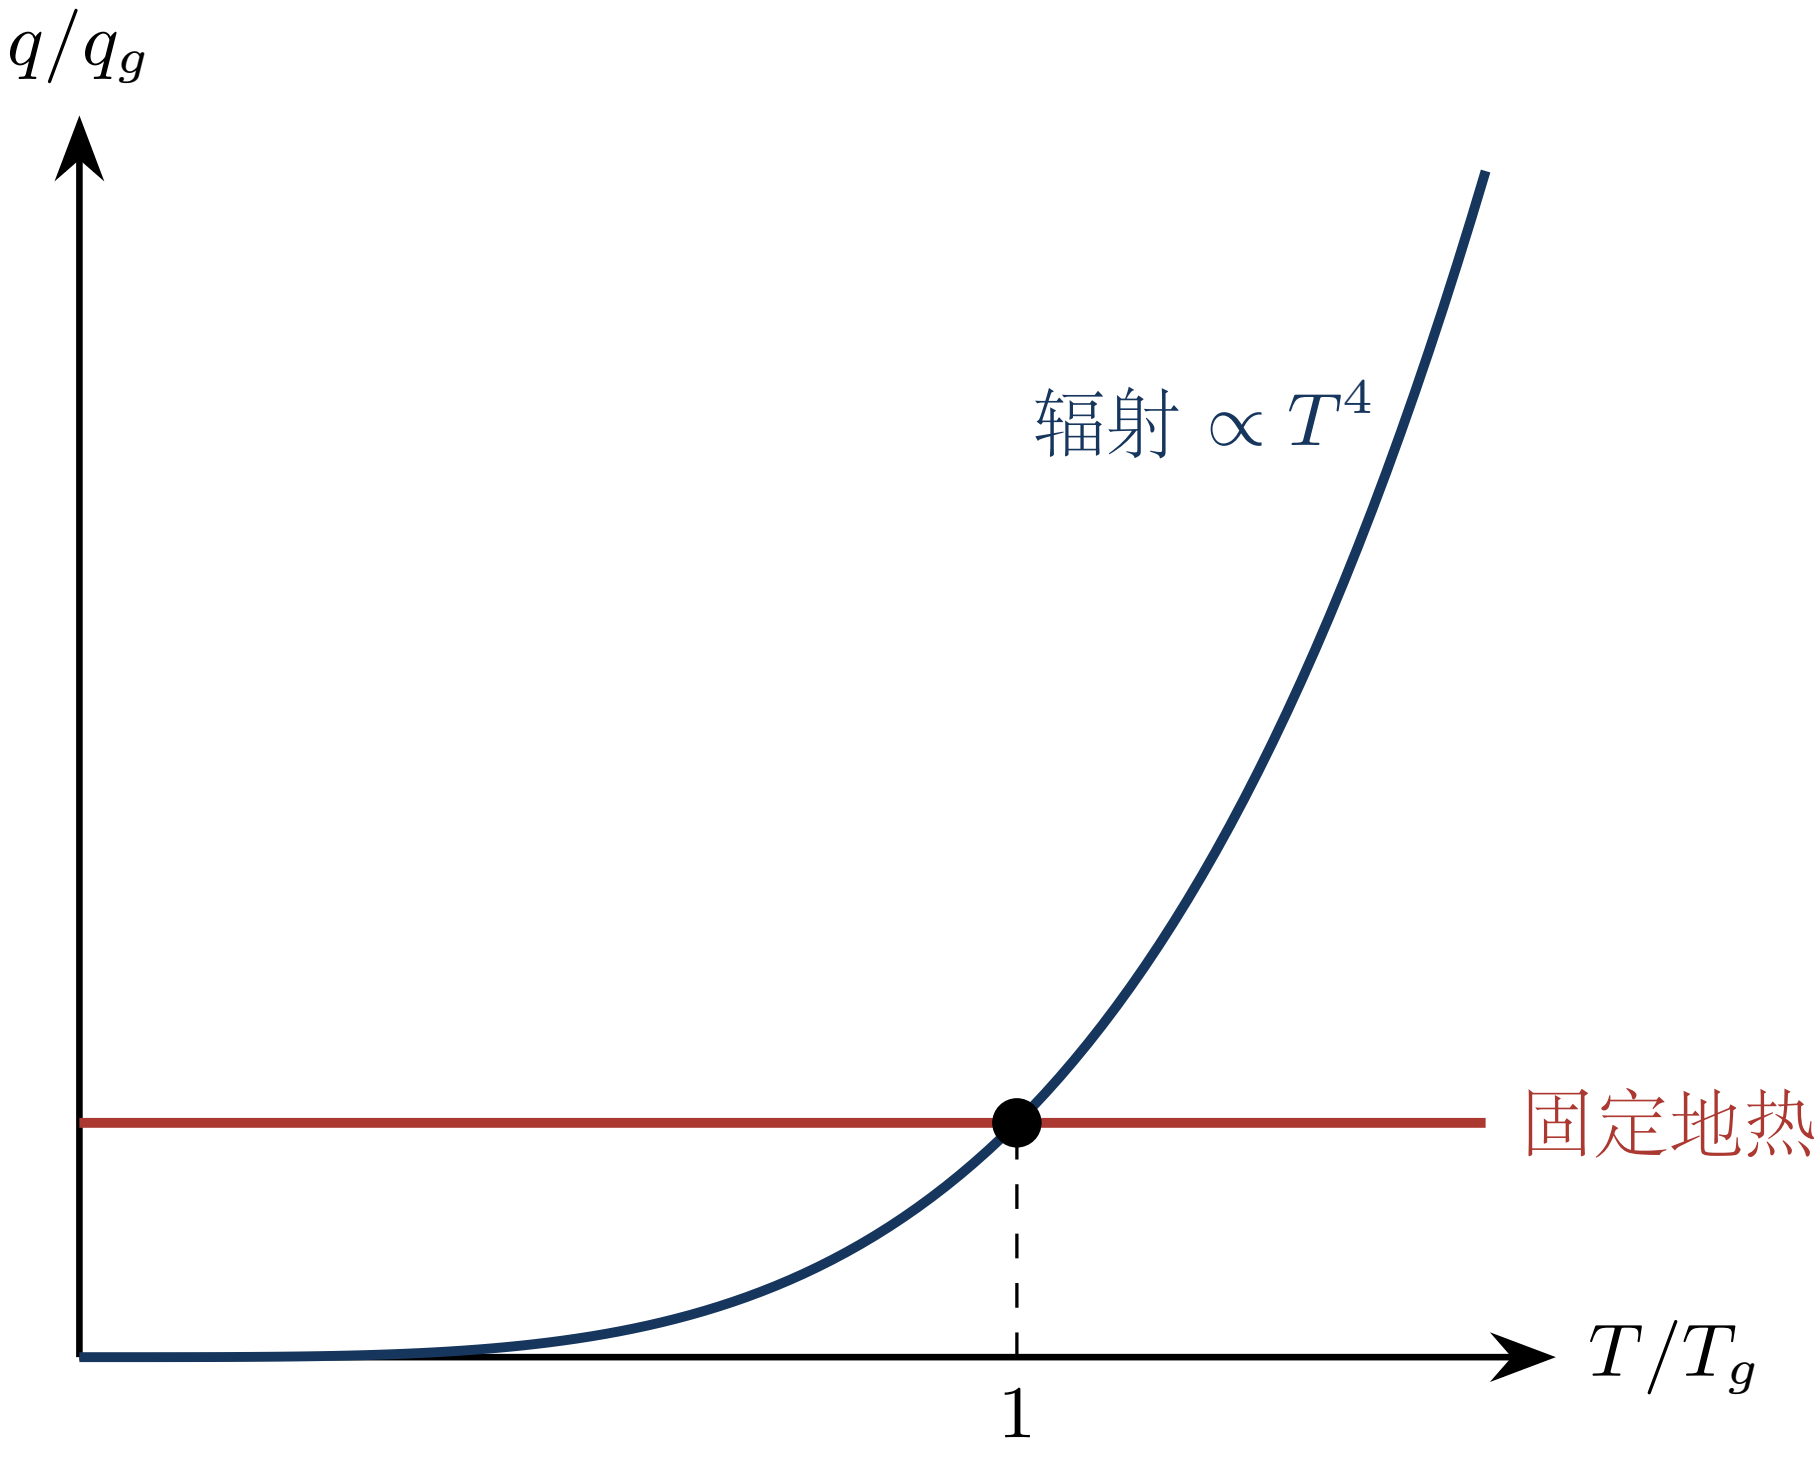
$4\pi R_E^2$

平均供热 $F_S/4$

接收投影 $\pi R_E^2$



$\sigma T_g^4 = q_g$
地表
100 m
$q_g = 0.12\ \mathrm{W/m^2}$
向深处升温 4 K
$\kappa = 3\ \mathrm{W/(m\,K)}$



交点 $T_g \simeq 38.14$ K
