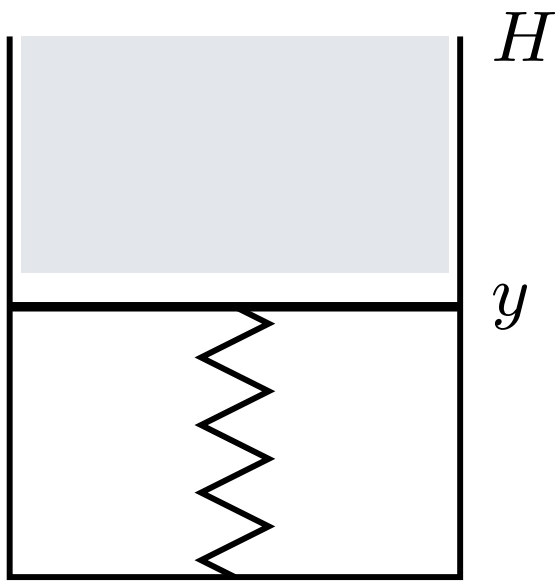
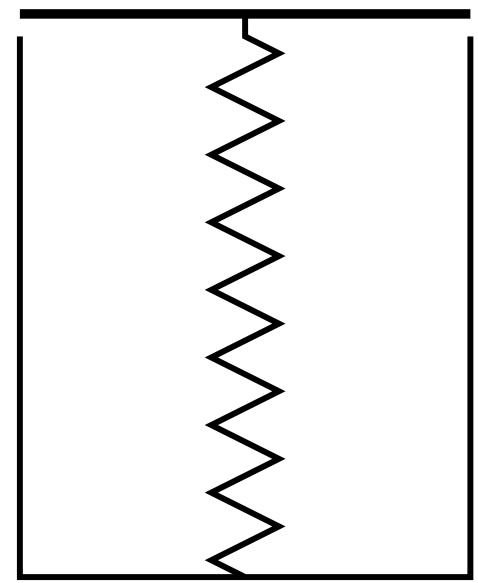
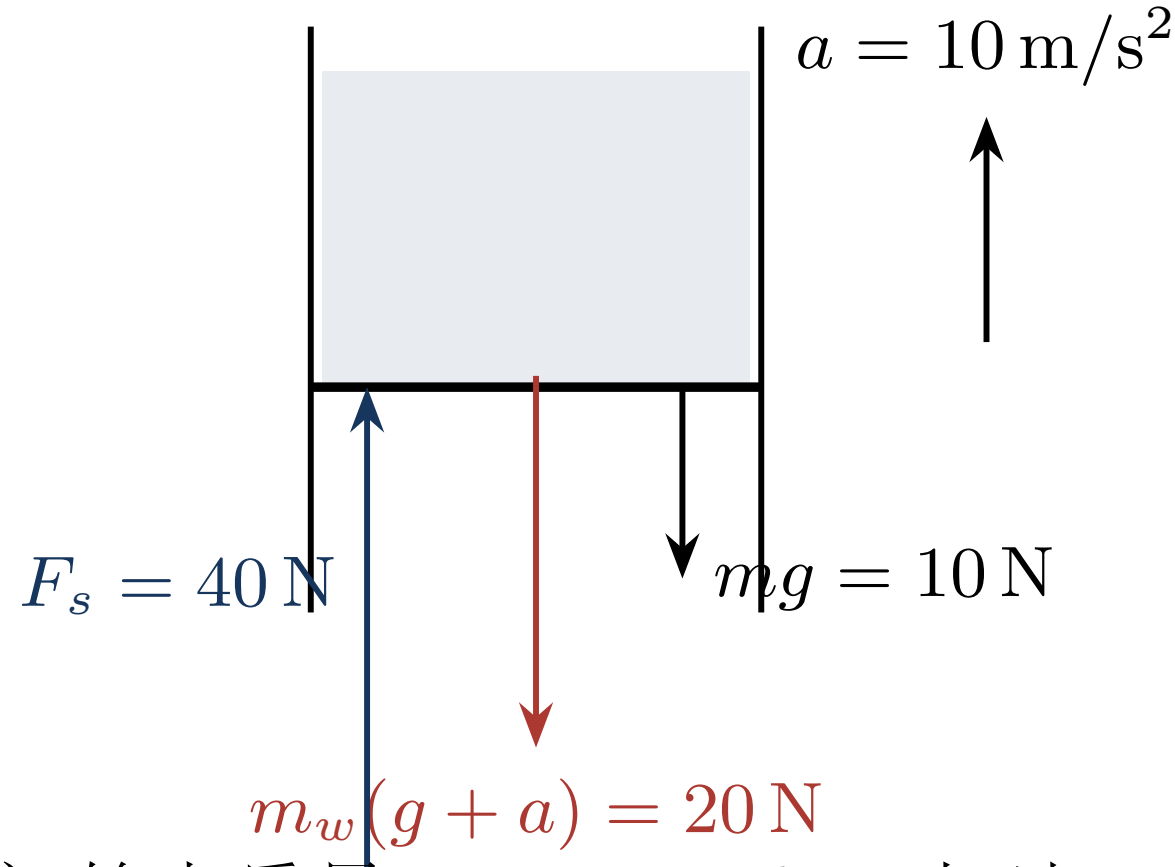
排水阶段 $h < y < H$



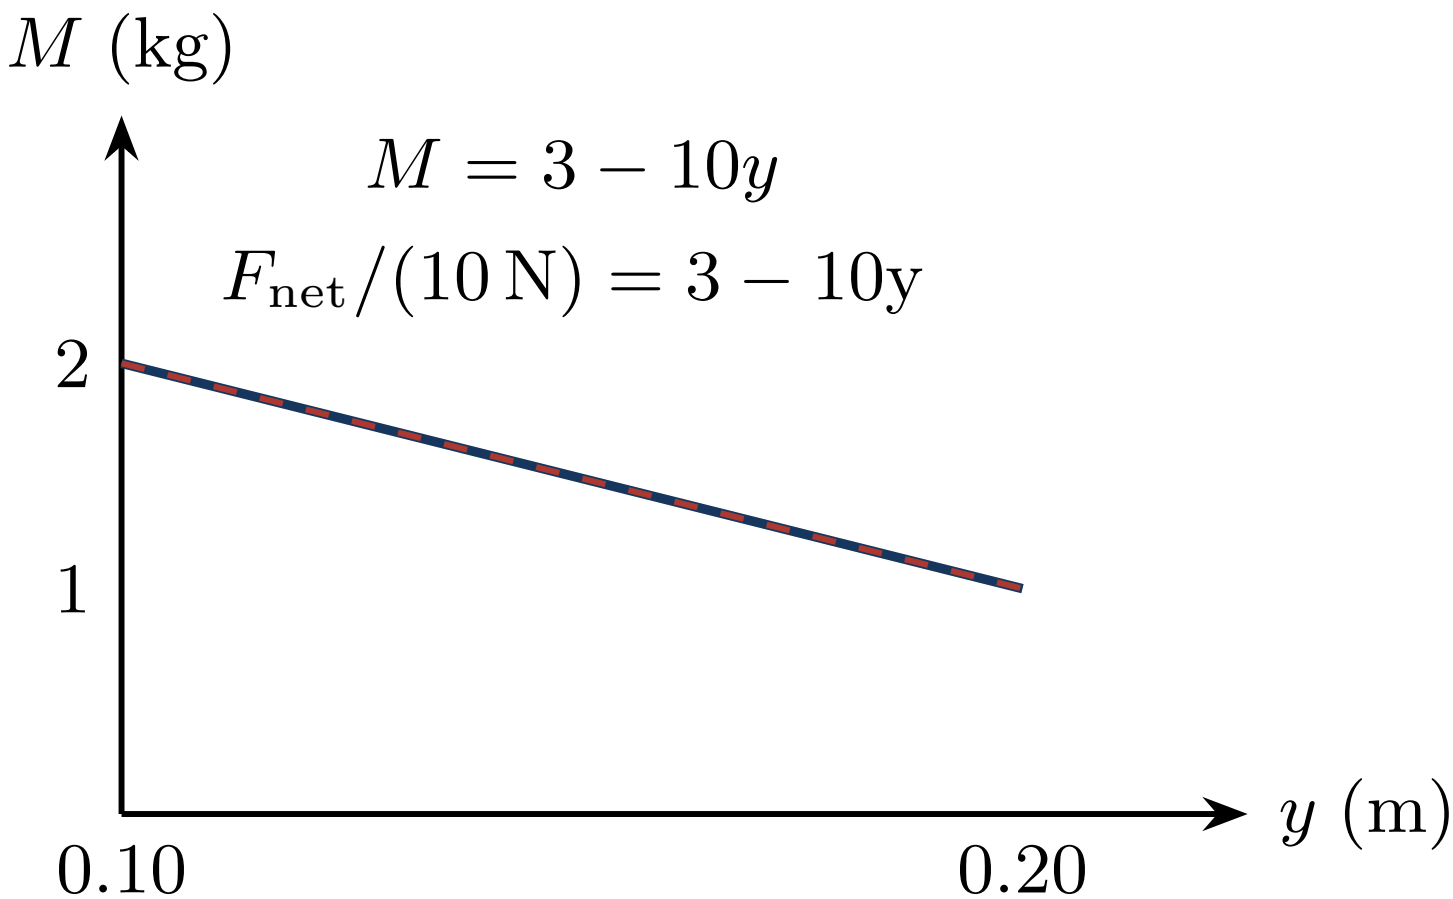
干燥阶段 $y > H$



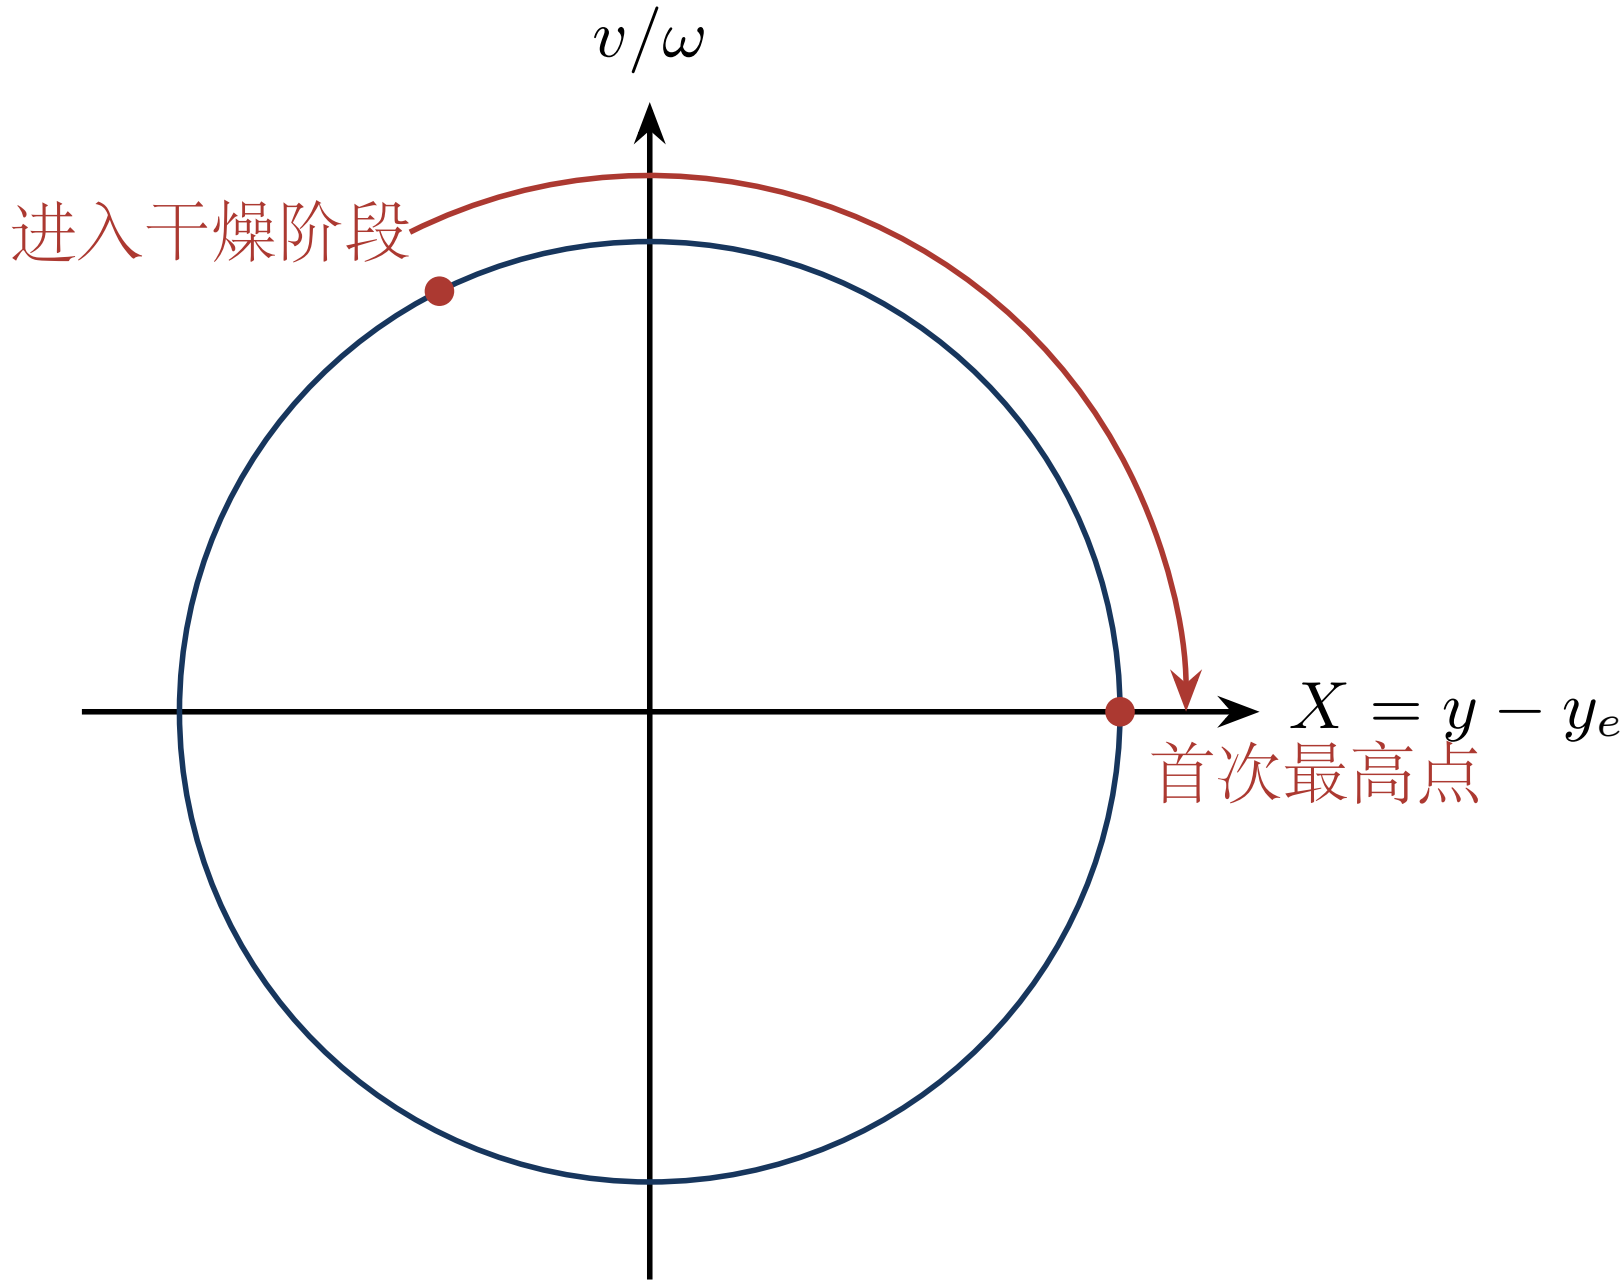
活塞向上；水从上口溢出。弹簧力为 $k(l_0 - y)$，可在越过自然长度后改为向下。



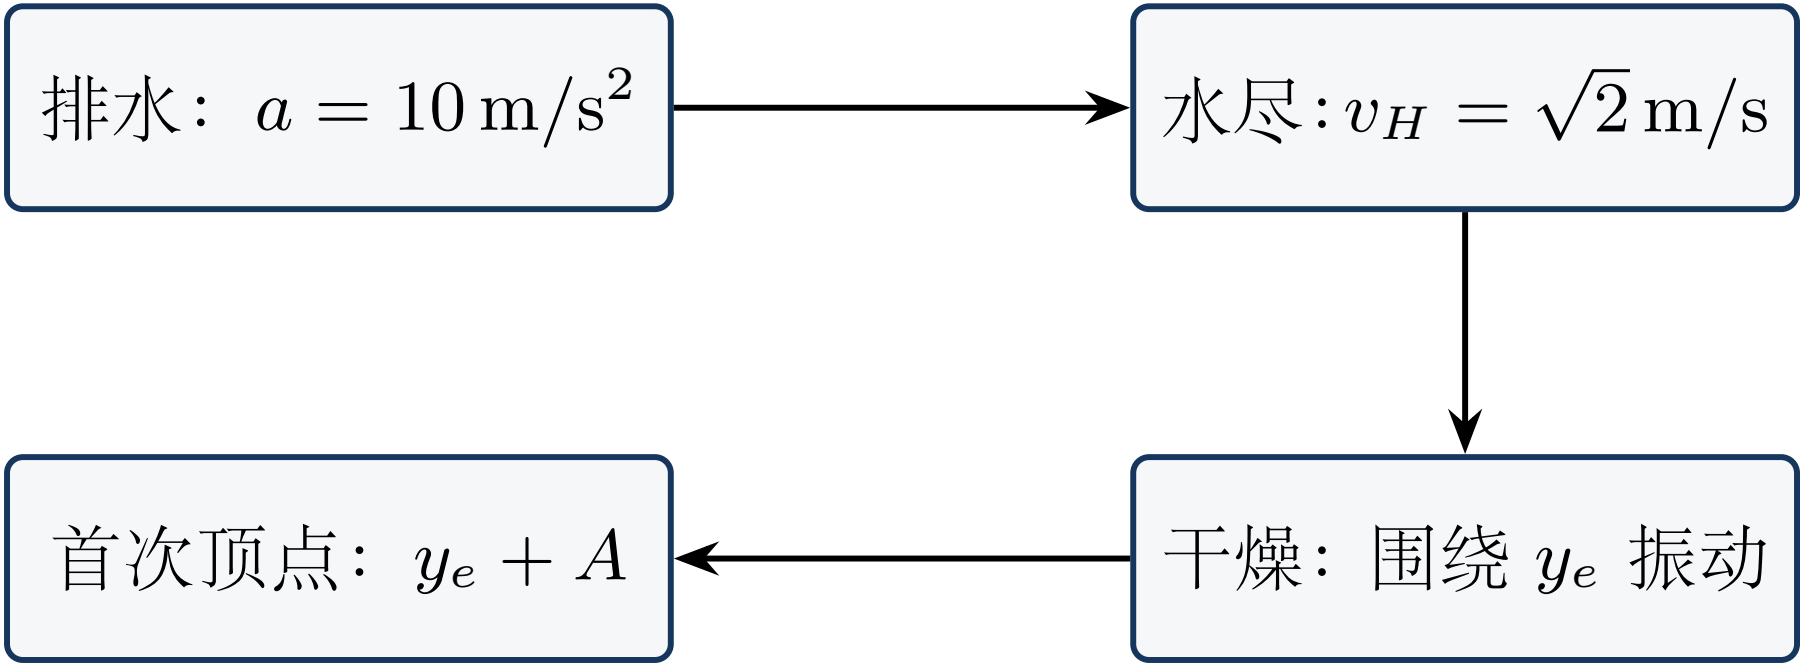
初始水质量 $m_w = 1\,\mathrm{kg}$；加速水柱的压力不能只用静水重力。



两条归一化曲线重合，所以排水阶段 $a = F_{\text{net}}/M = 10\,\text{m/s}^2$。



$y_e = 0.25\,\mathrm{m}$, $A = \sqrt{5}/20\,\mathrm{m}$; 相位转角 $\pi/2 + \arctan(1/2)$。



总位移 $(3 + \sqrt{5})/20\,\mathrm{m}$；总时间约 $0.2853\,\mathrm{s}$。
