

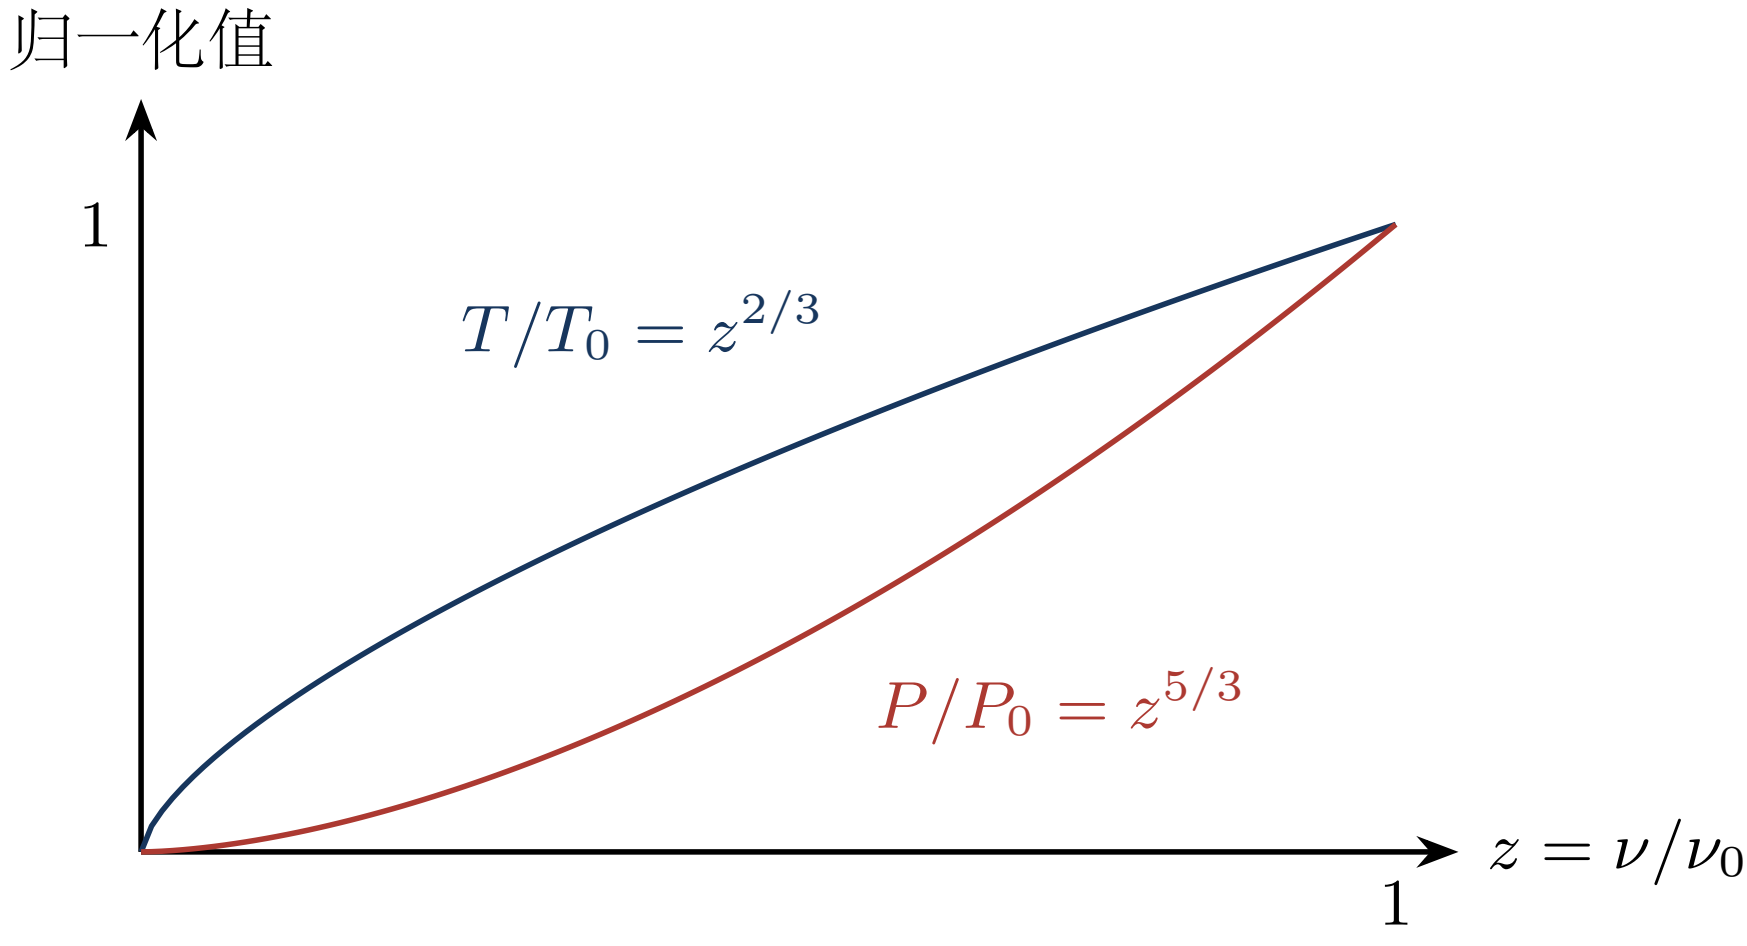
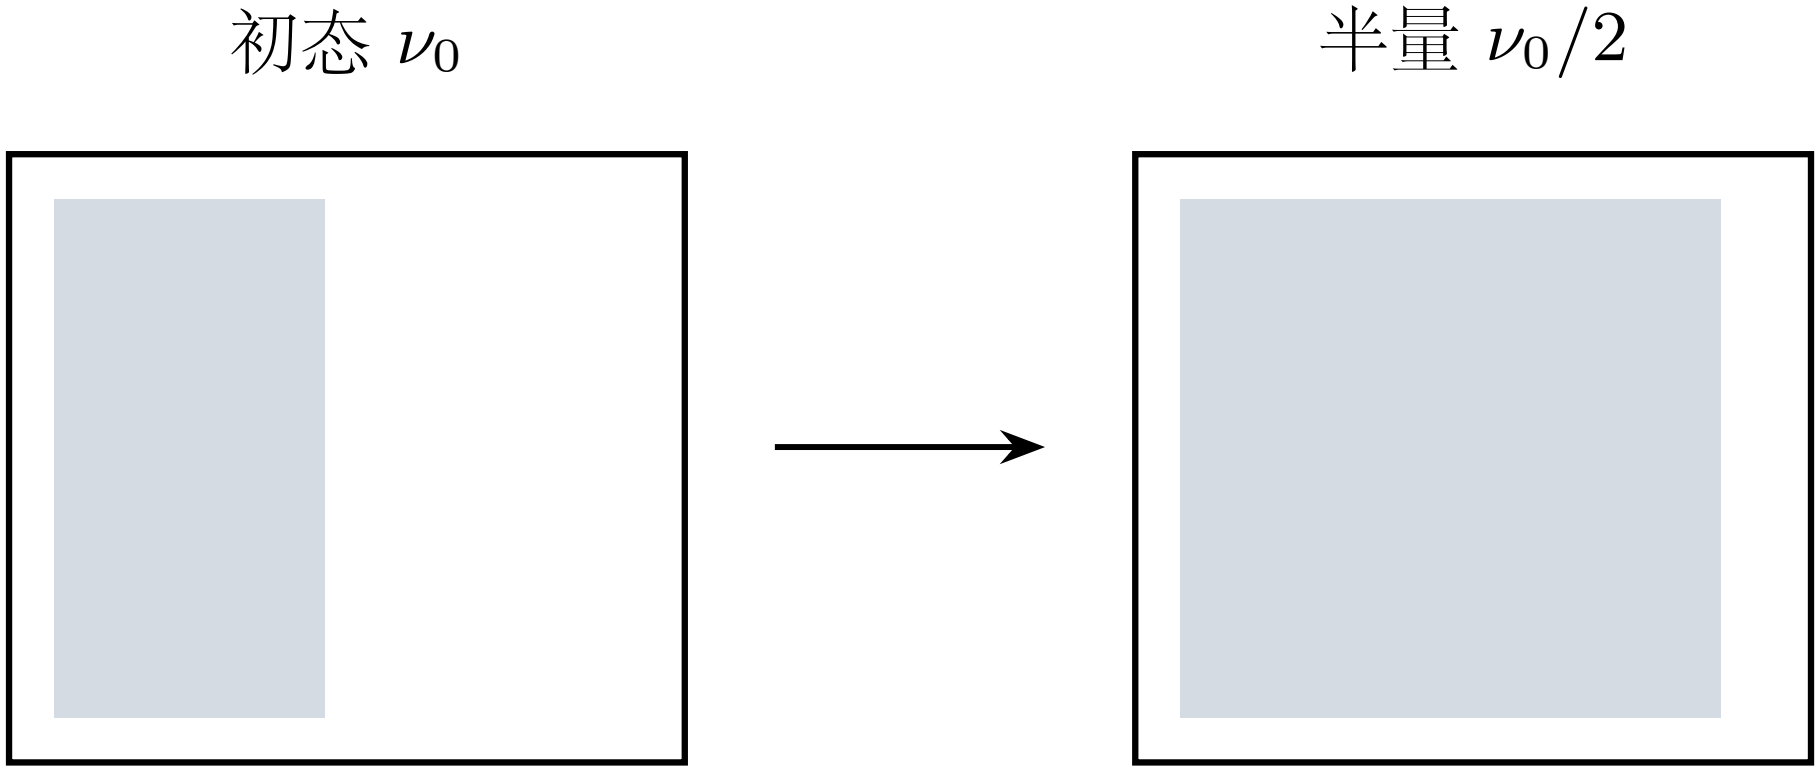
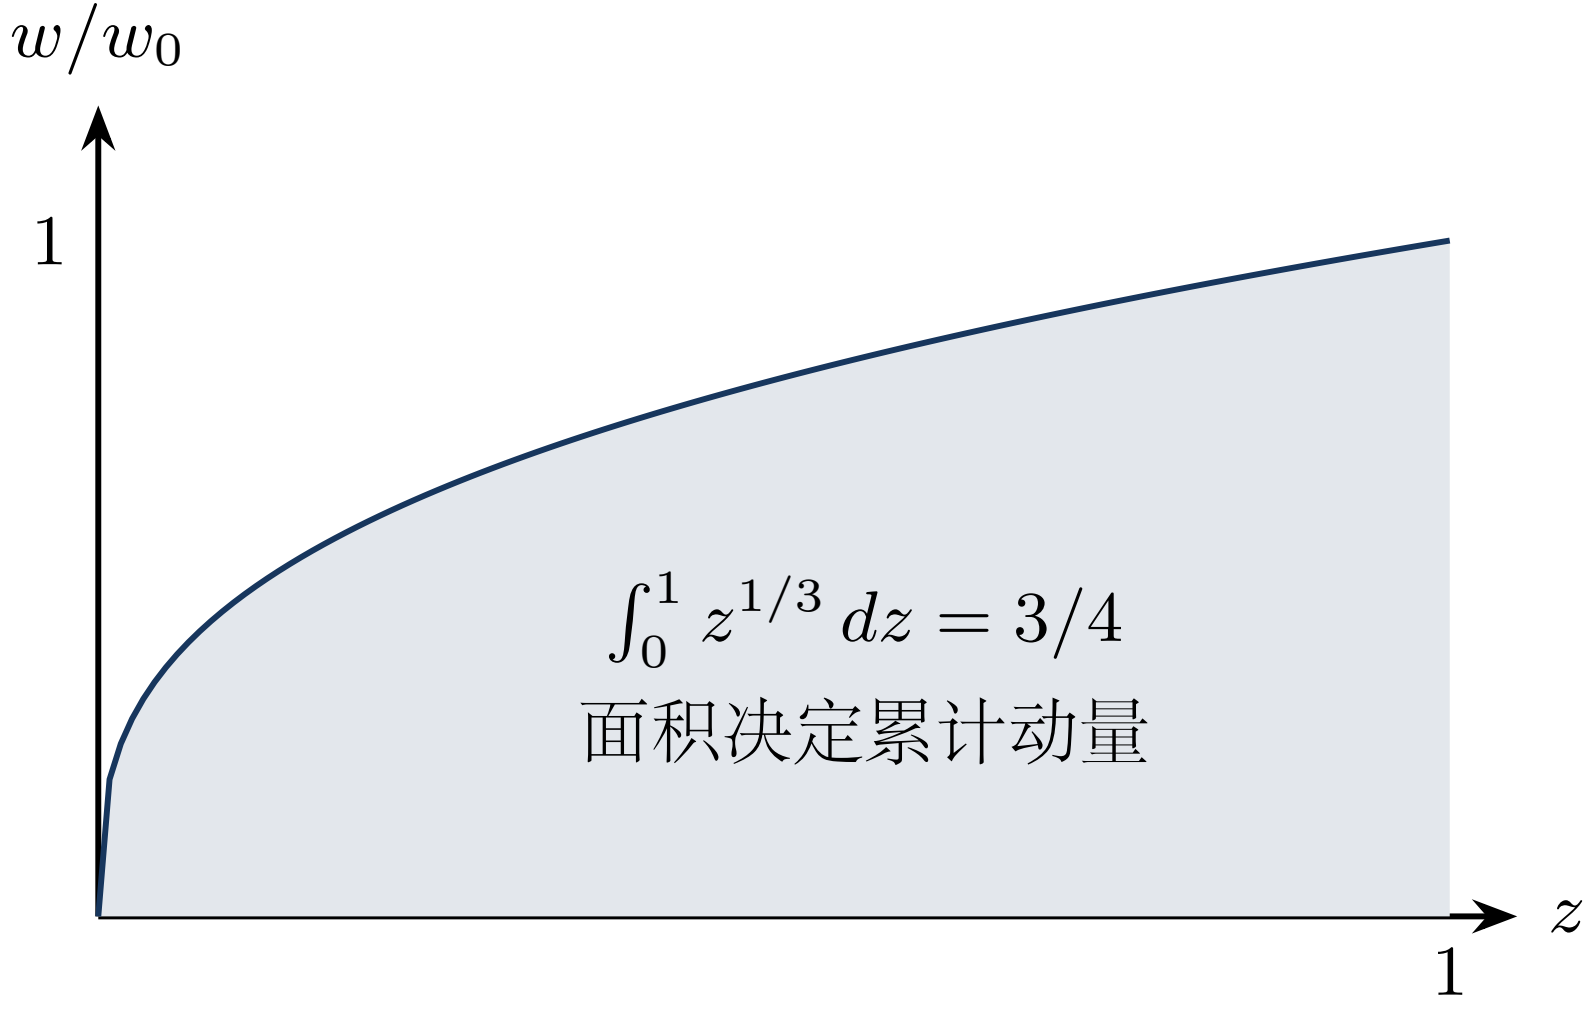
缓慢均匀绝热排气；单侧定向喷流。箱体很重，反冲速度修正忽略。



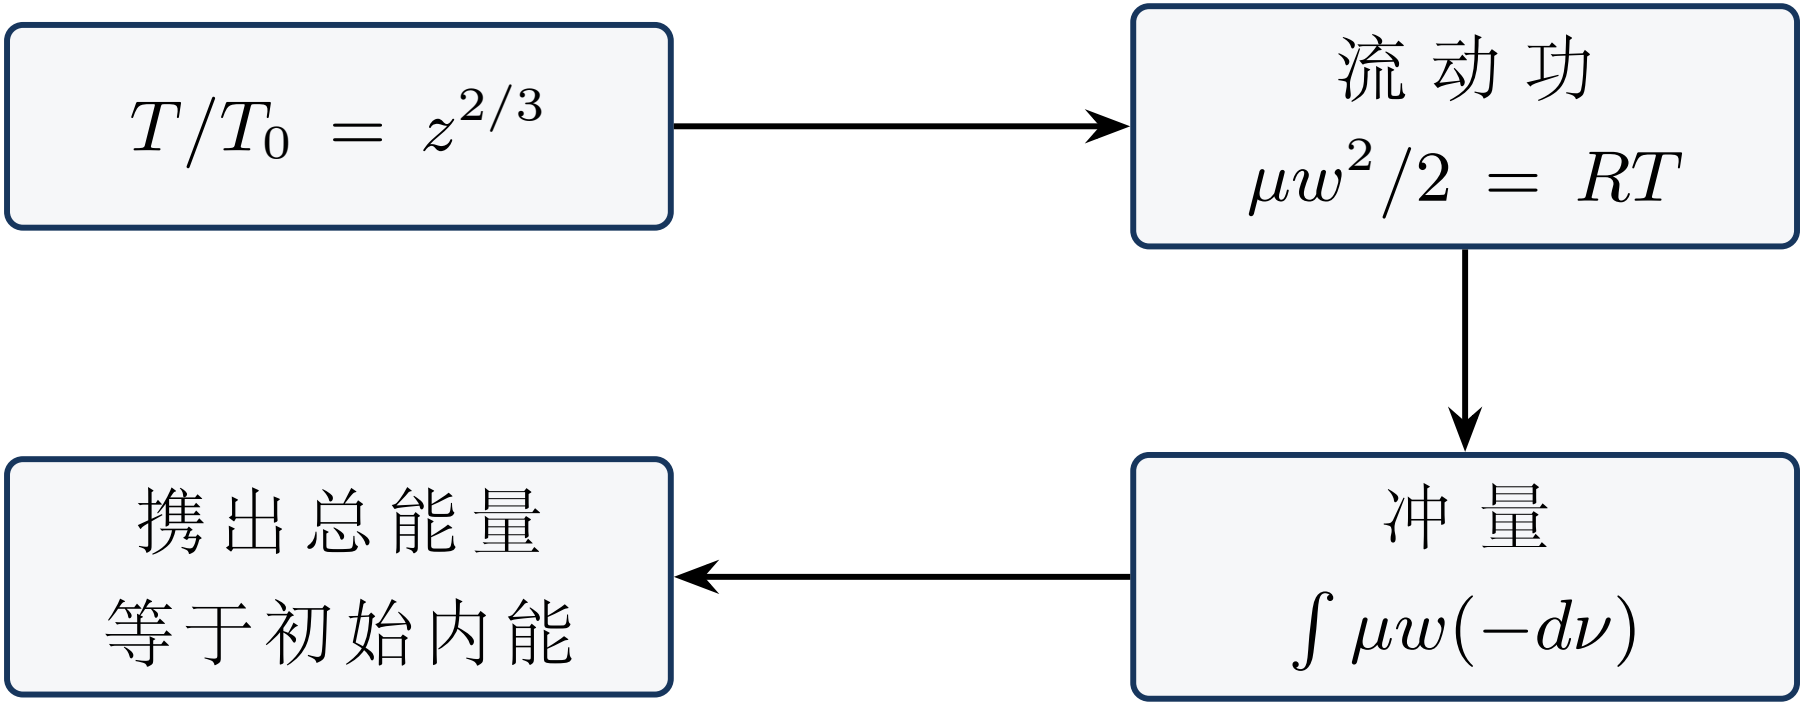
半量时 $T/T_0 = 0.62996$，$P/P_0 = 0.31498$；箱体几何容积不变。



着色表示同一固定微团的份额体积；半量时其体积加倍，可写定量绝热关系。



$w_0 = \sqrt{2RT_0/\mu}$；后段气体较冷，单位质量的冲量贡献下降。



原模型保留流出内能；全部焓转为动能的理想喷管是另一组条件。
