
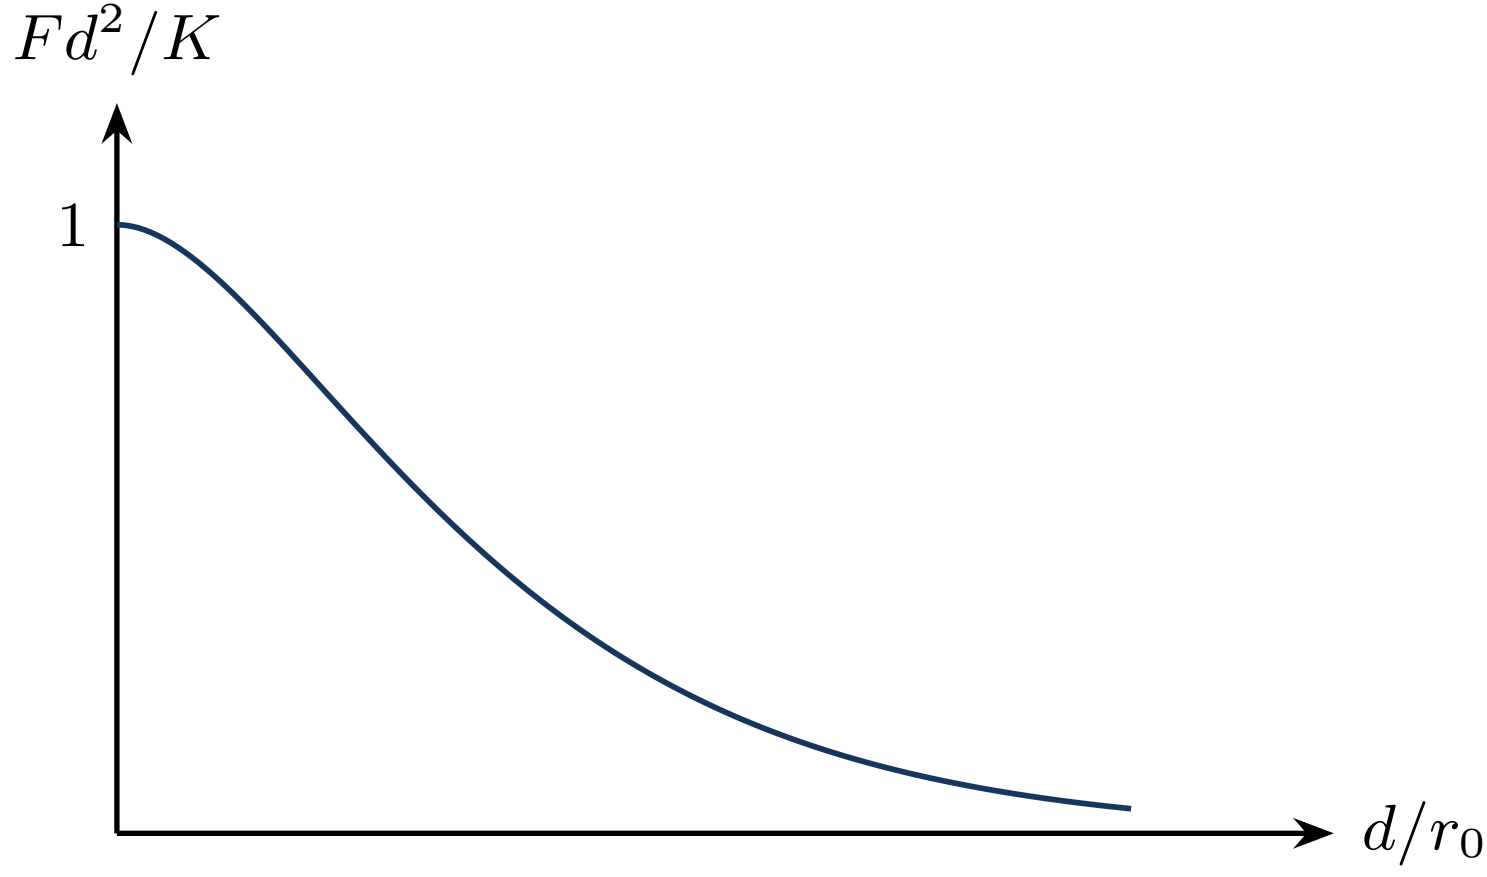
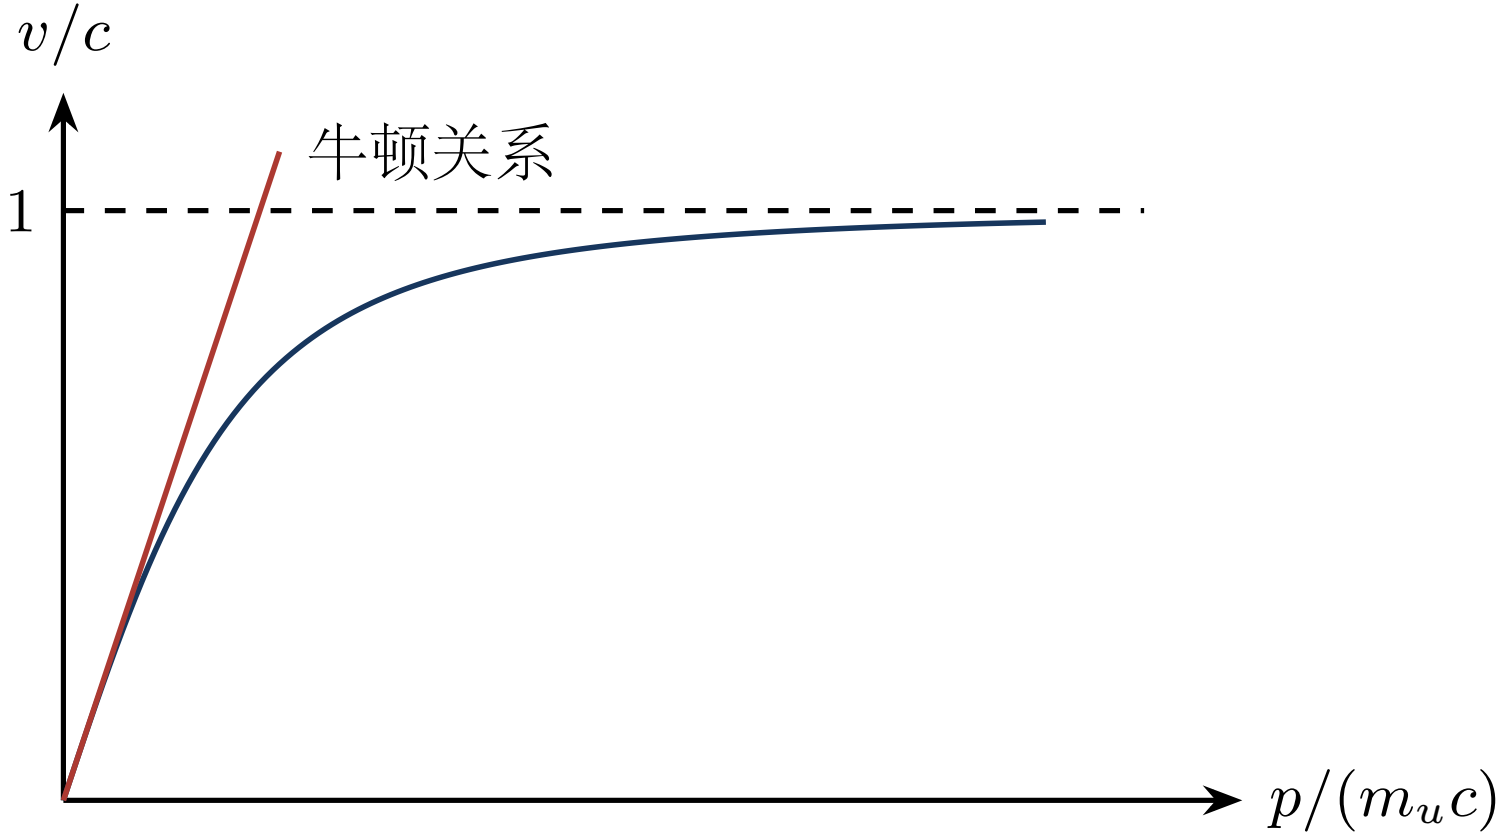
$$\text{总角动量 } L \quad = \quad 2ap \quad = \quad dp \quad = \quad n\hbar$$



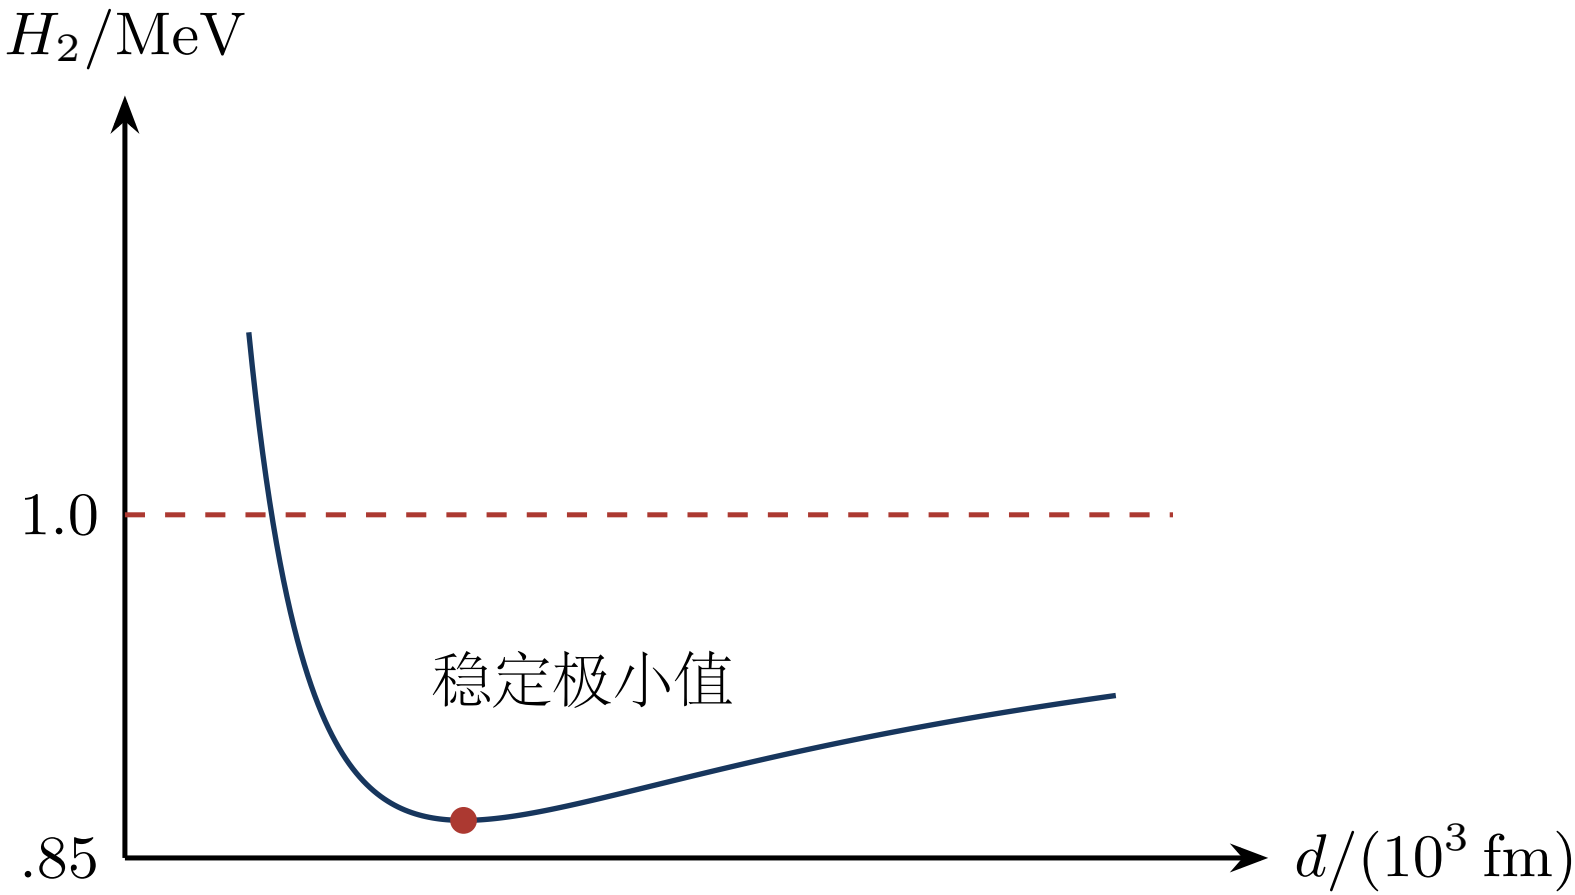
$$Fd^2/K = e^{-x}(1 + x)$$

短距近库仑，长距吸引受指数抑制



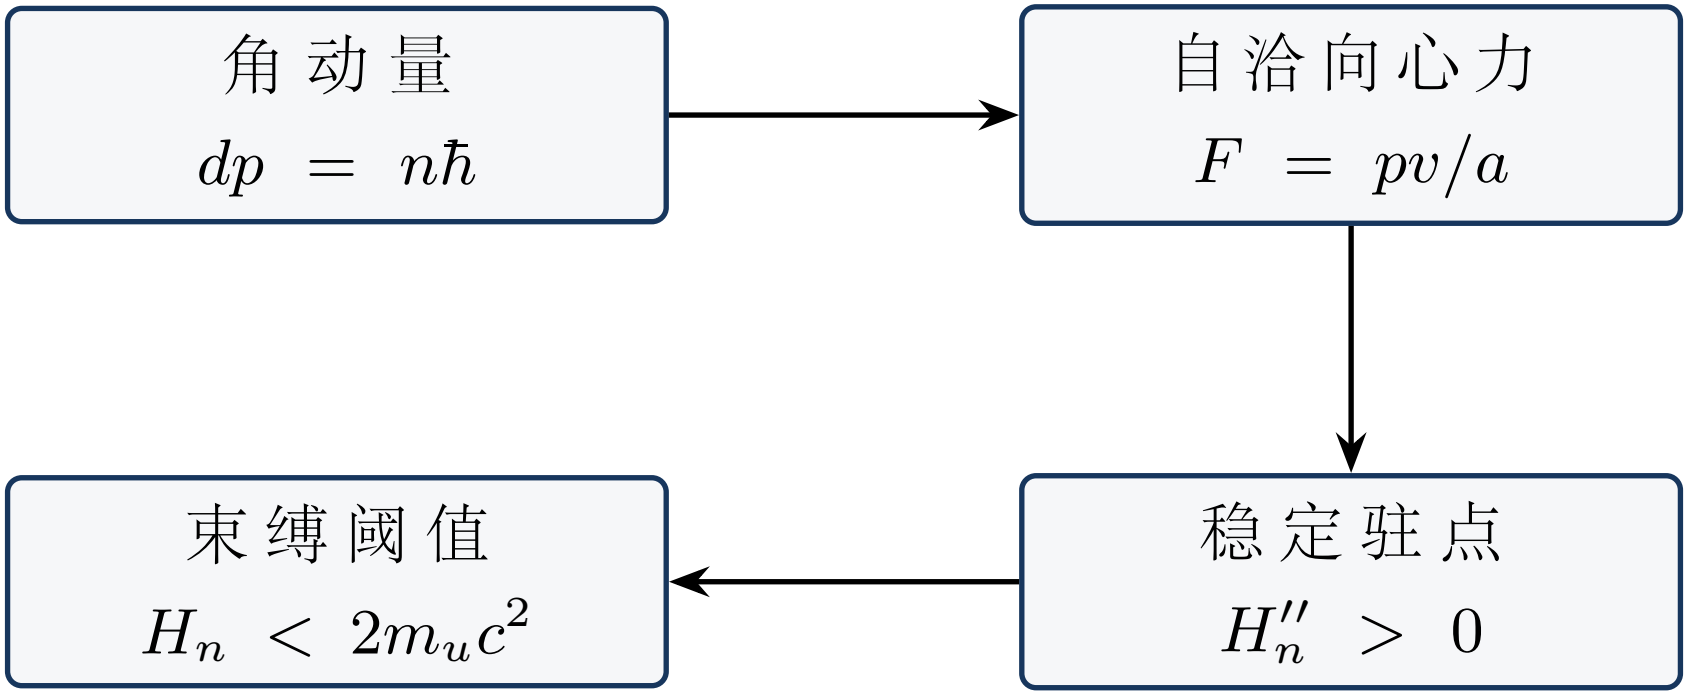
相对论：$v/c \quad = \quad s/\sqrt{1+s^2}$

题给动量 $s \quad \simeq \quad 1644$，速度趋近 c



示例 $r_0 = 10^6\,\mathrm{fm}$，重新校准相对论 K

$d_2 \simeq 1367\,\mathrm{fm}$，$H_2 \simeq .86642\,\mathrm{MeV}$



r_0 未给，激发态与含势能的质量不能唯一确定
