
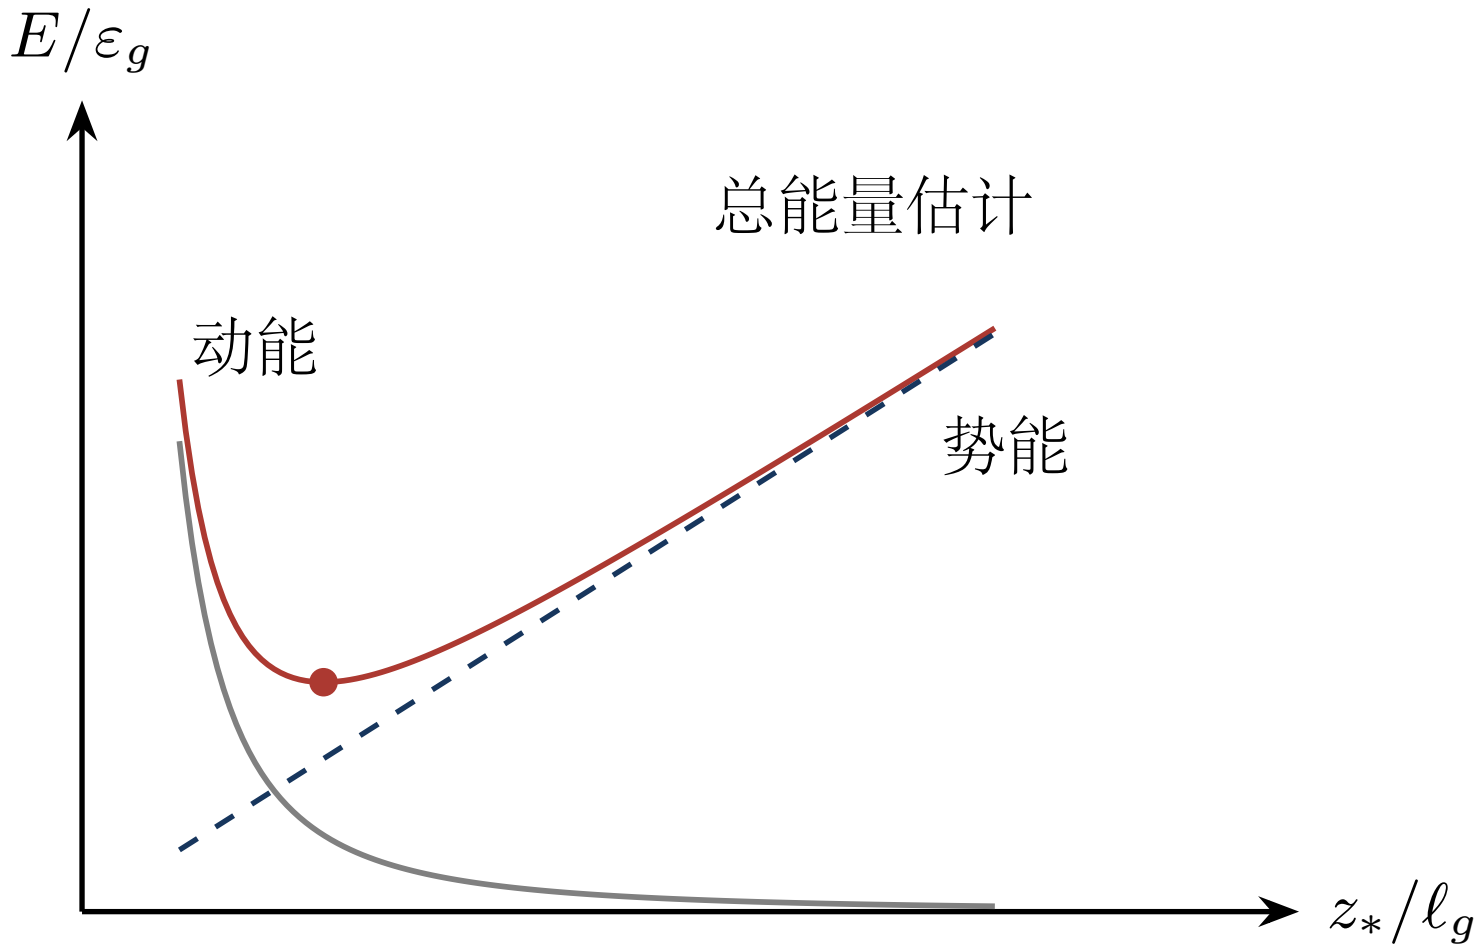
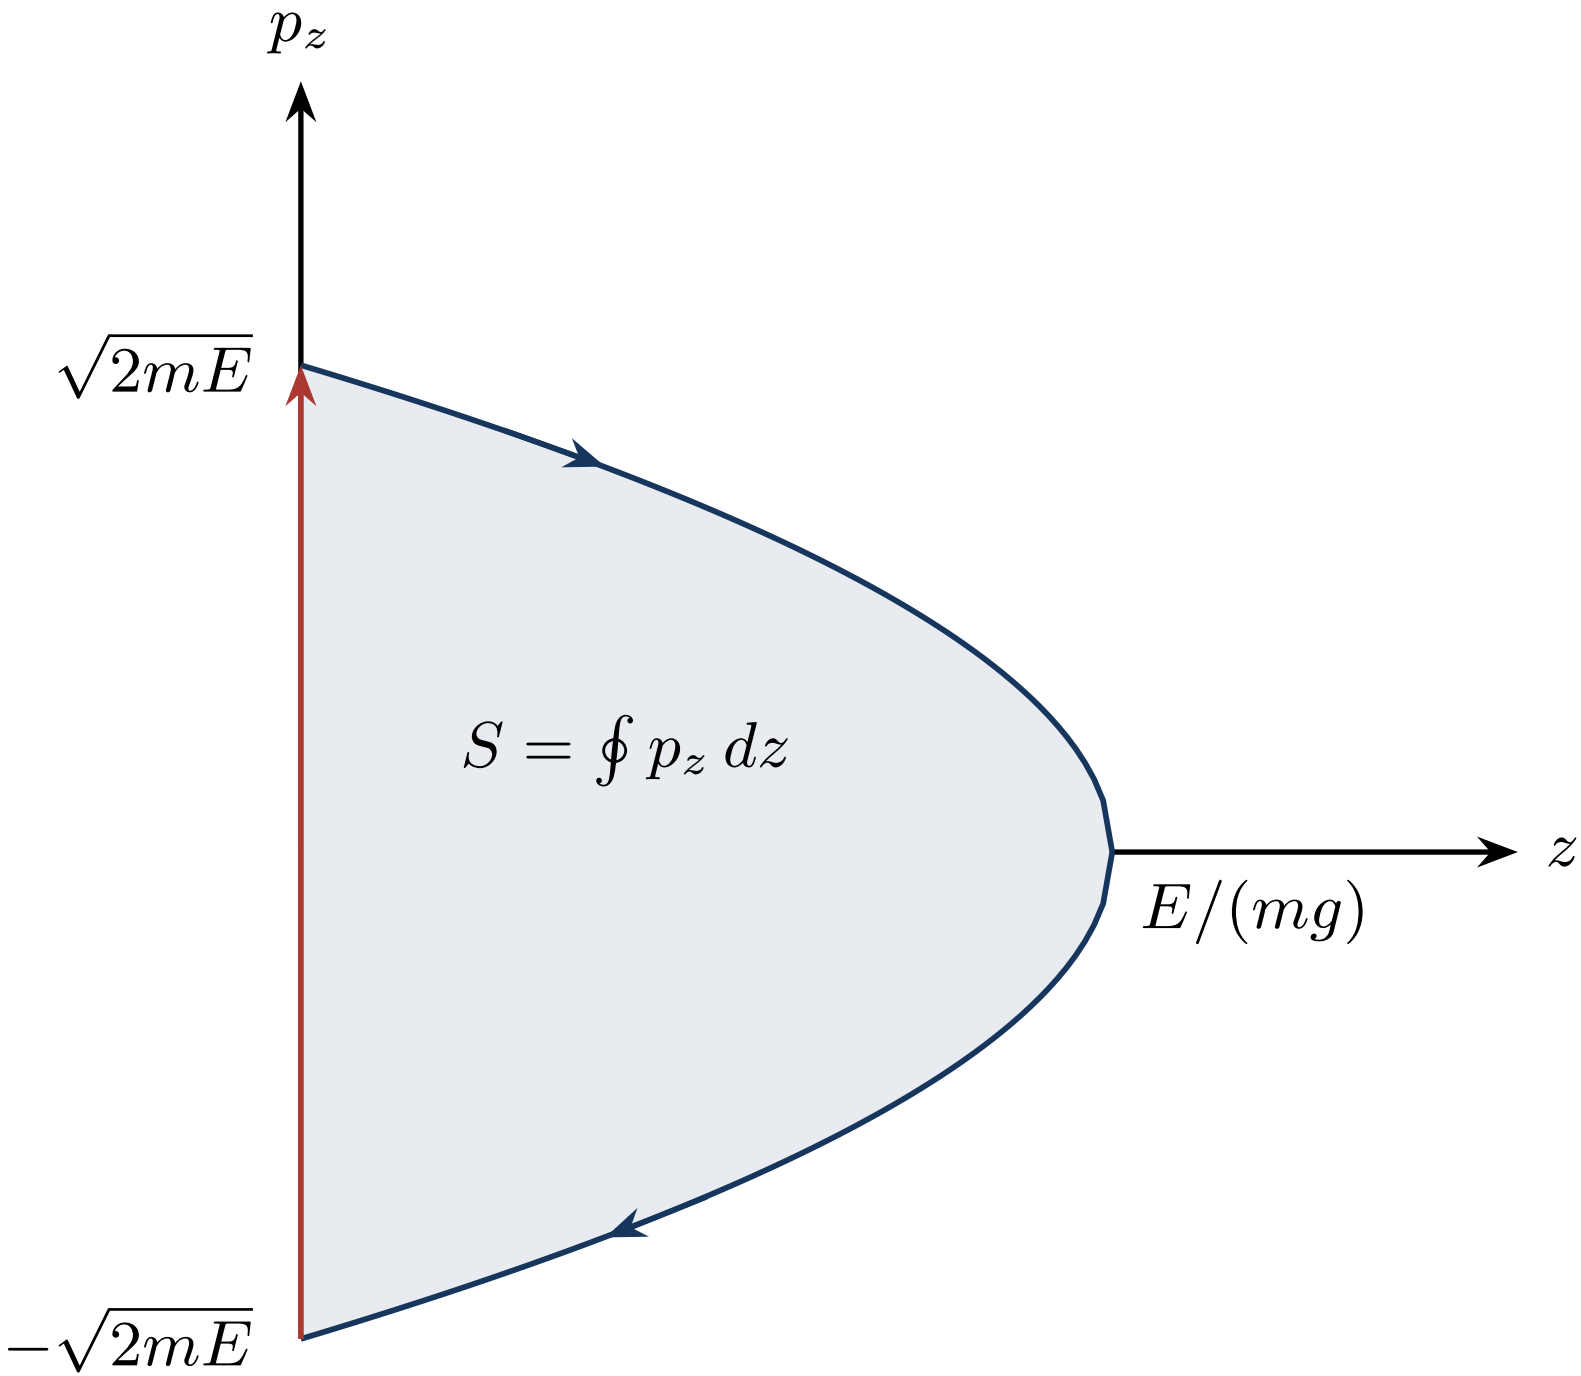
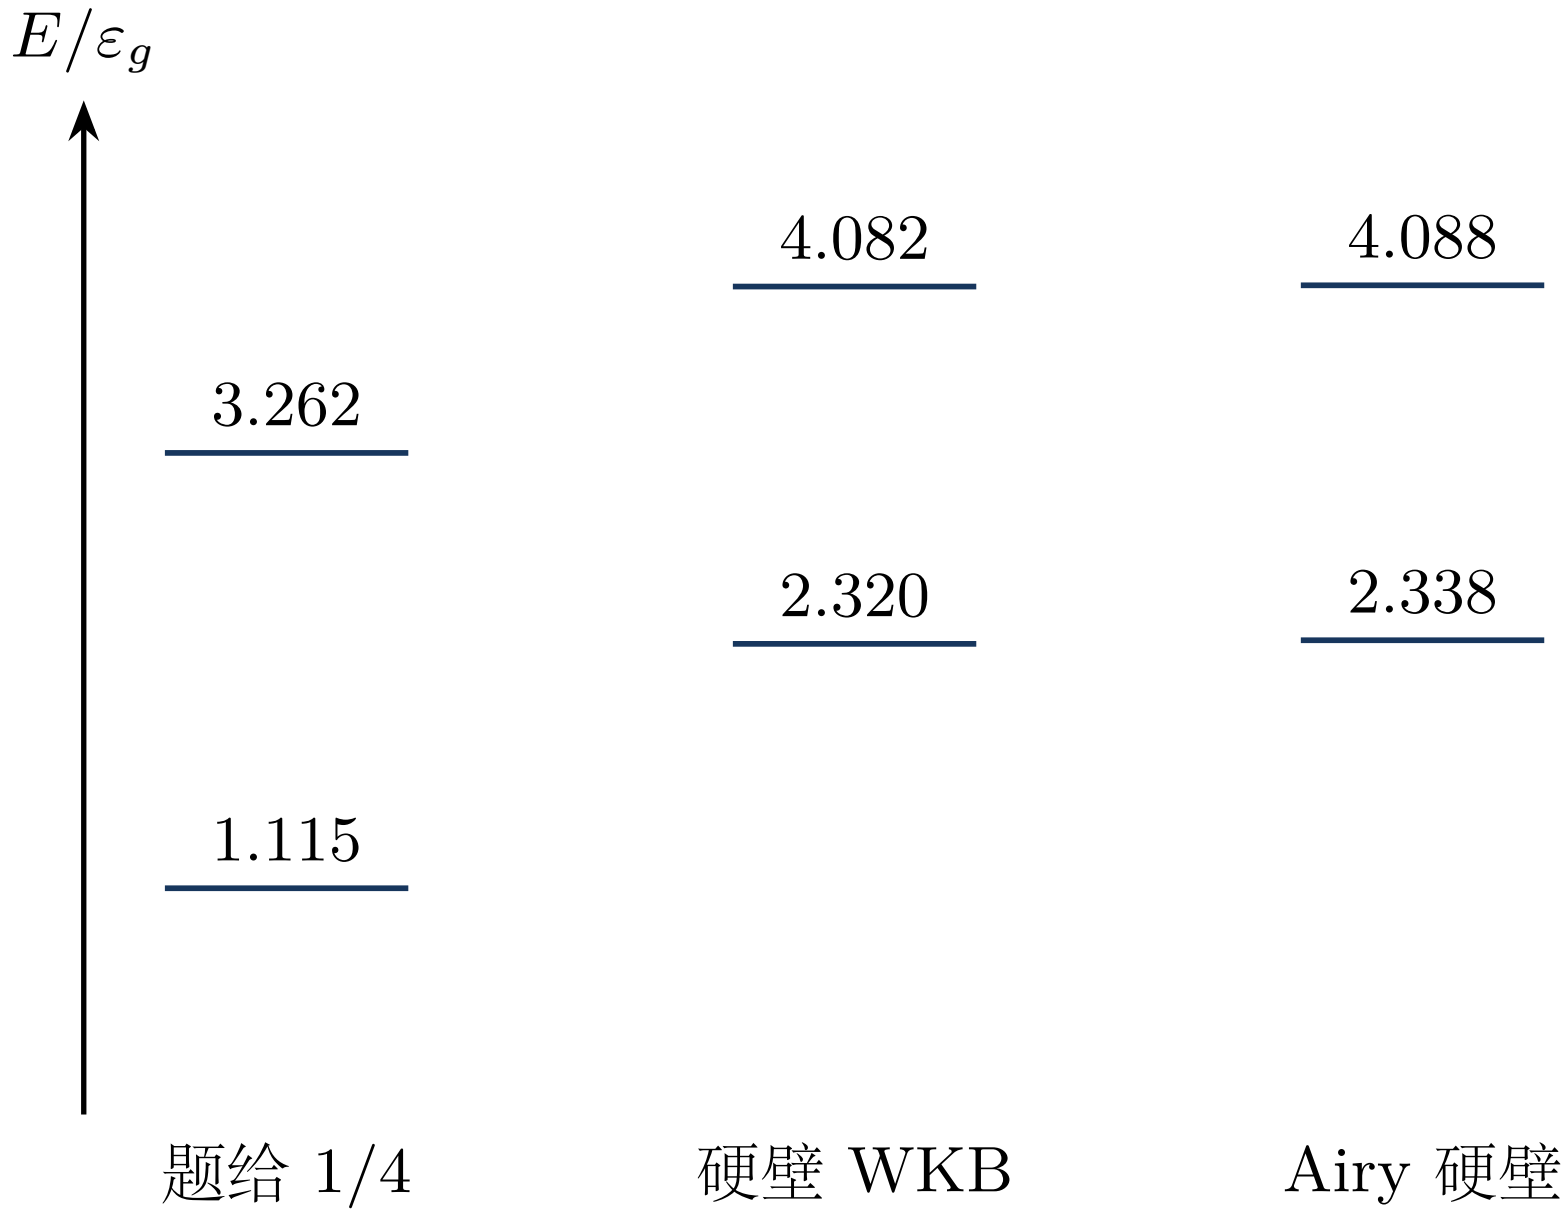
$z = 0$ 为硬壁；允许区 $z > 0$，通常取 $\psi(0) = 0$



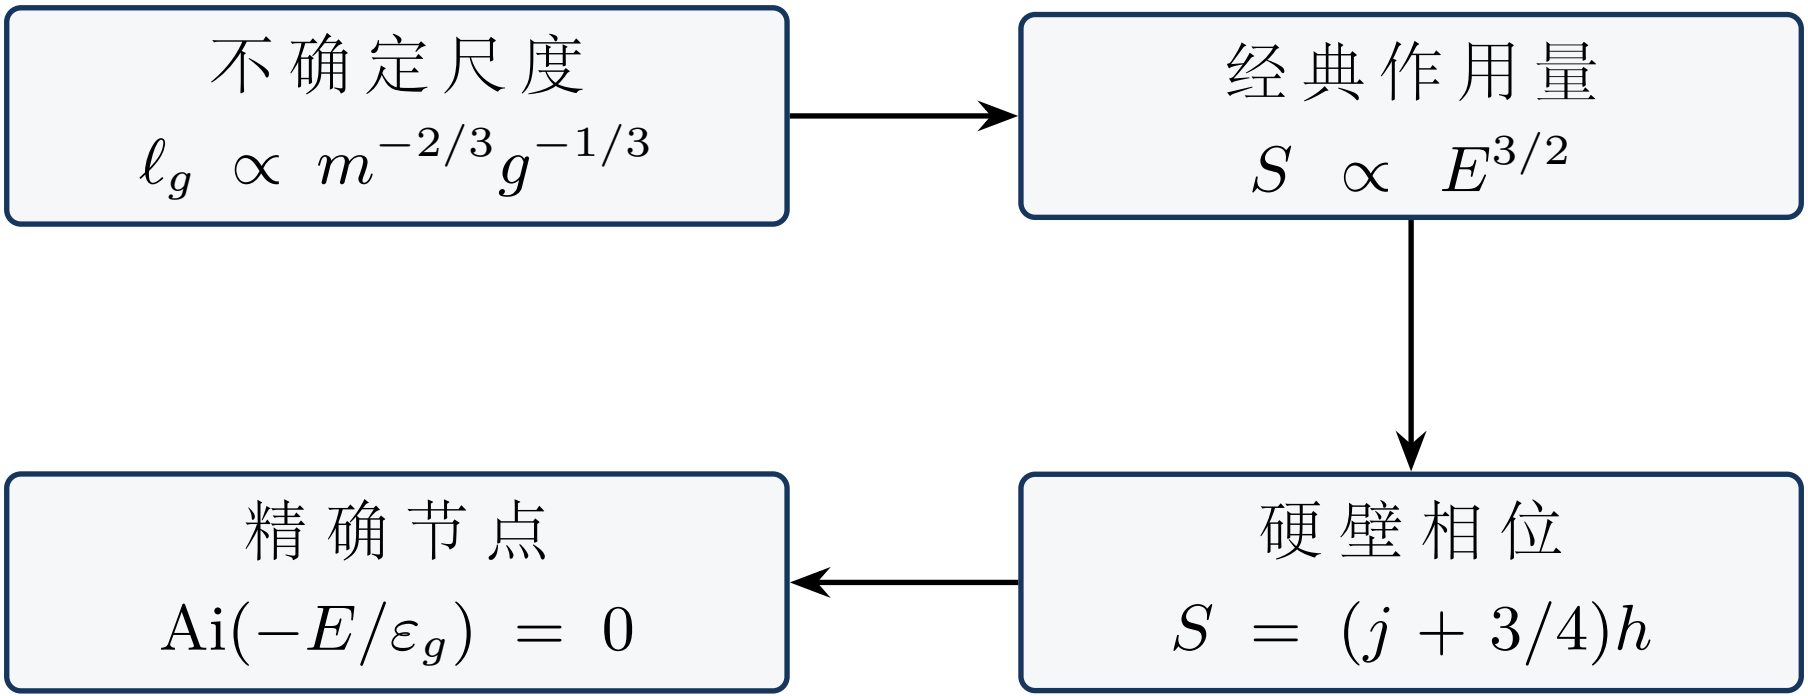
估计 $E/\varepsilon_g = x + 1/(4x^2)$; $x_* = 2^{-1/3}$



上升、下降和地面弹性反射组成一周；面积包含两支



经典作用量相同，量子反射边界相位不同；低能级不能混用



题给 $n + 1/4$ 先按形式解处理；它可对应另一种反射相位
