
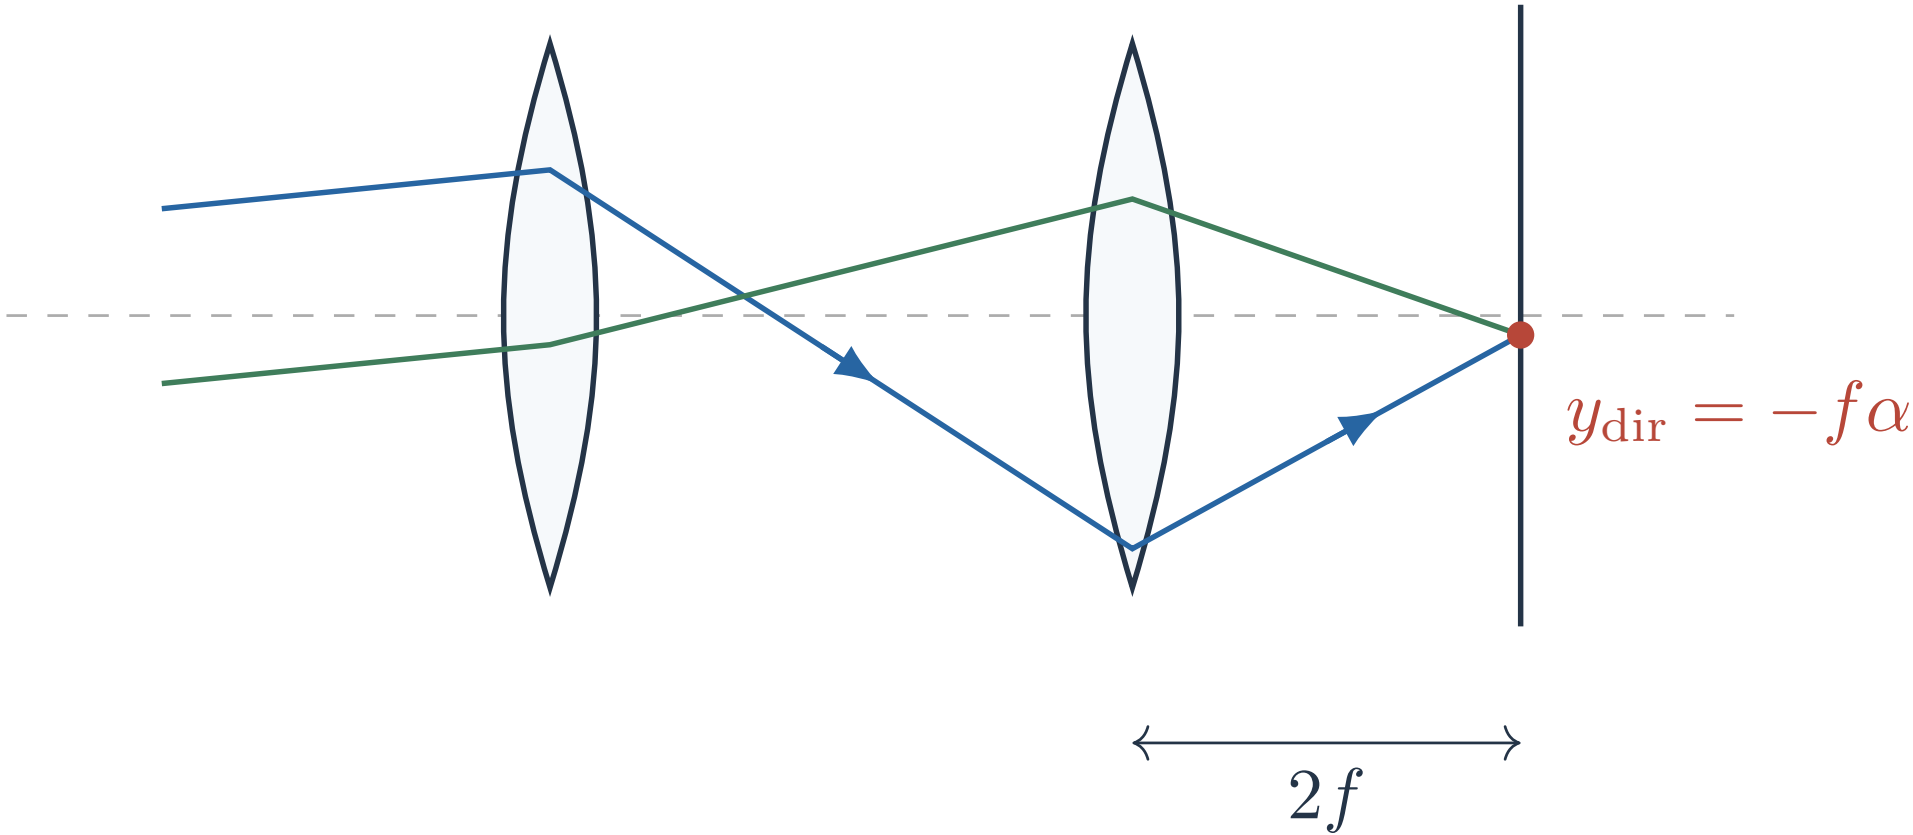
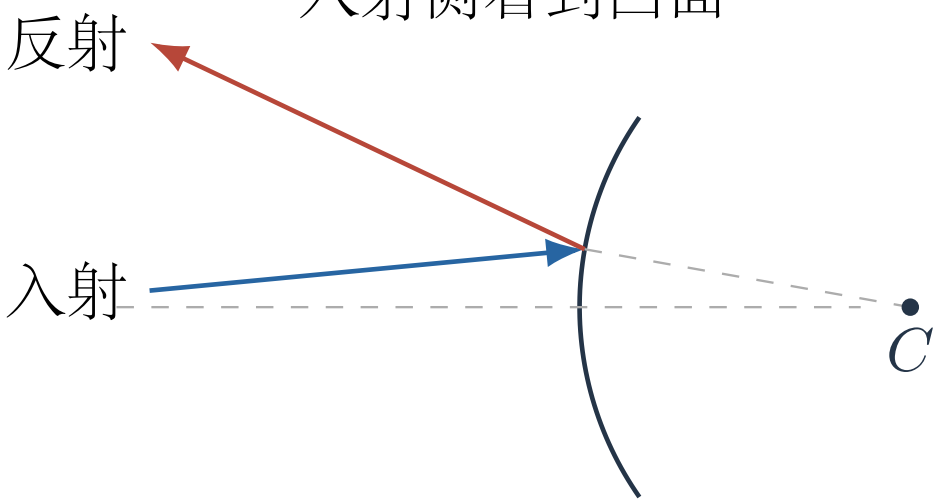
两个薄双凸透镜：焦距 f，球面半径大小 f

h 可不同　　$y_2 = -2h + 3f\alpha$



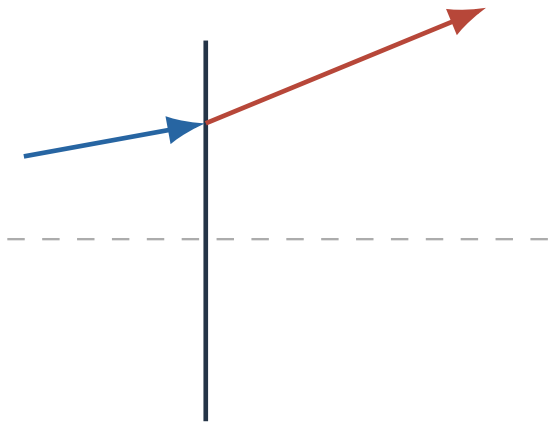
纵向放大示意；两条光线的交点相同

入射侧看到凸面

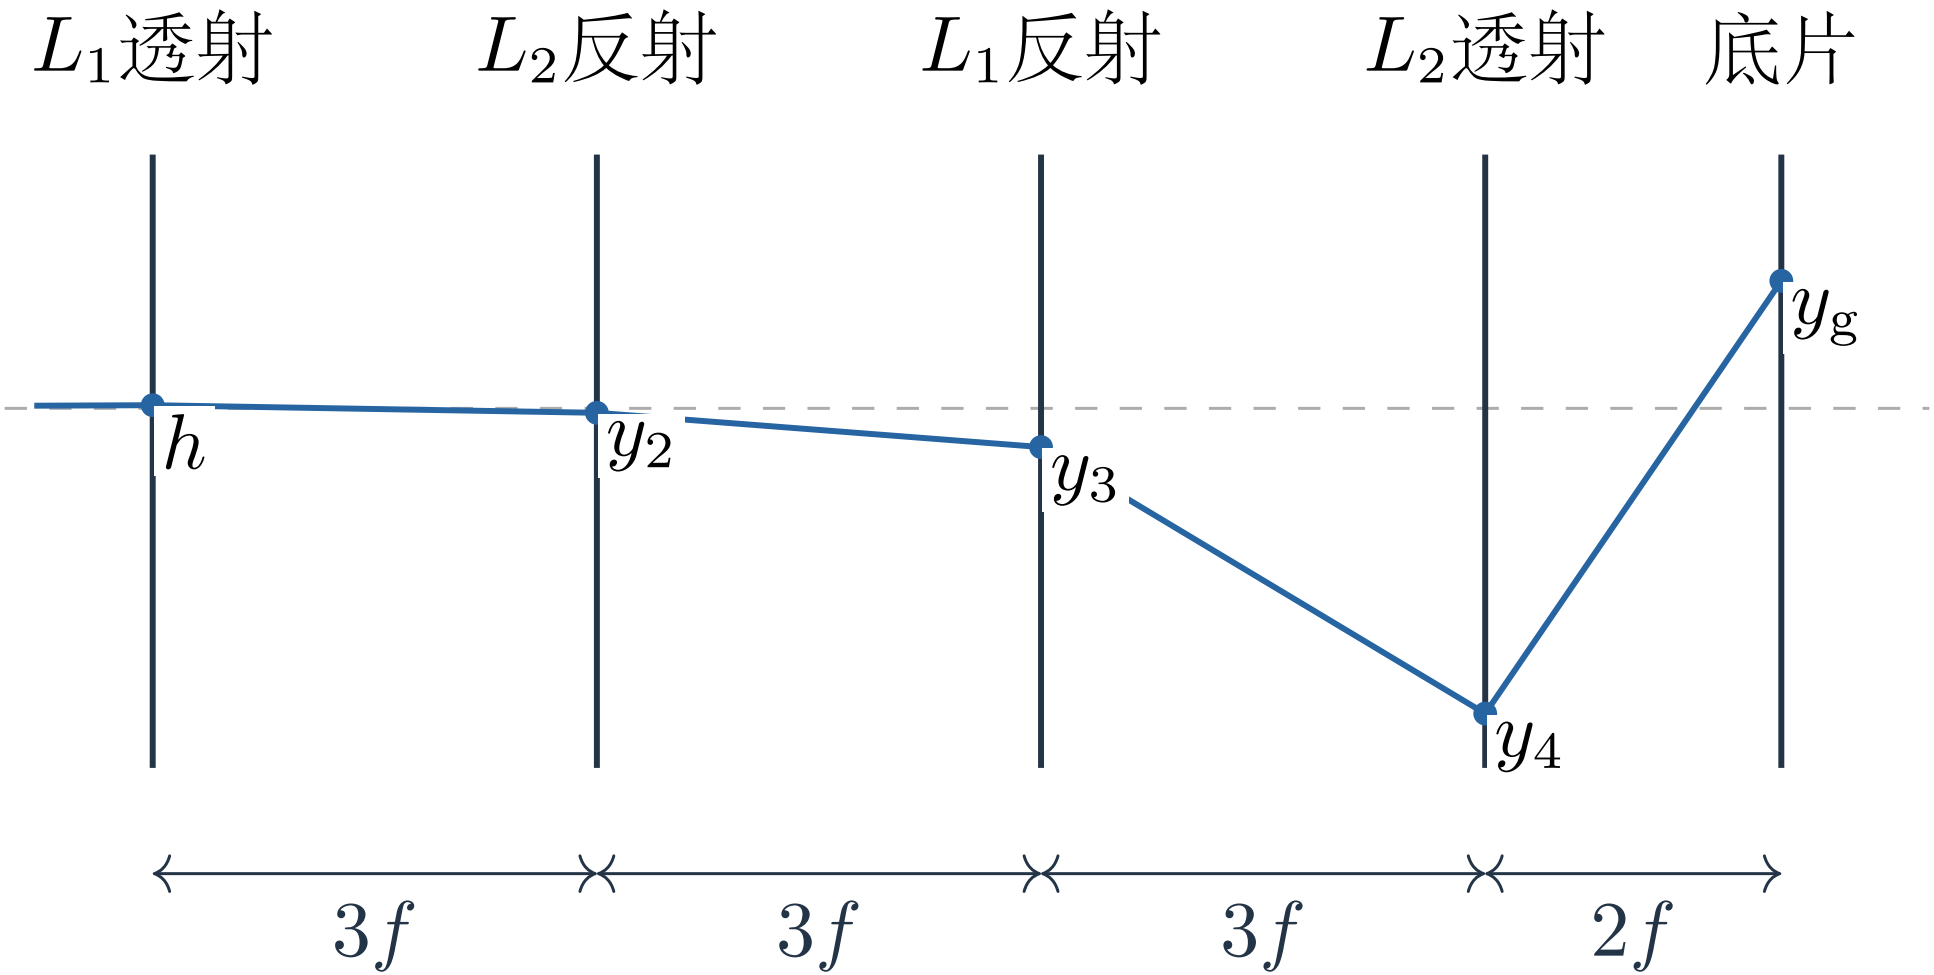


$$\eta_{\text{out}} = \eta_{\text{in}} + 2y/f$$

沿传播方向展开

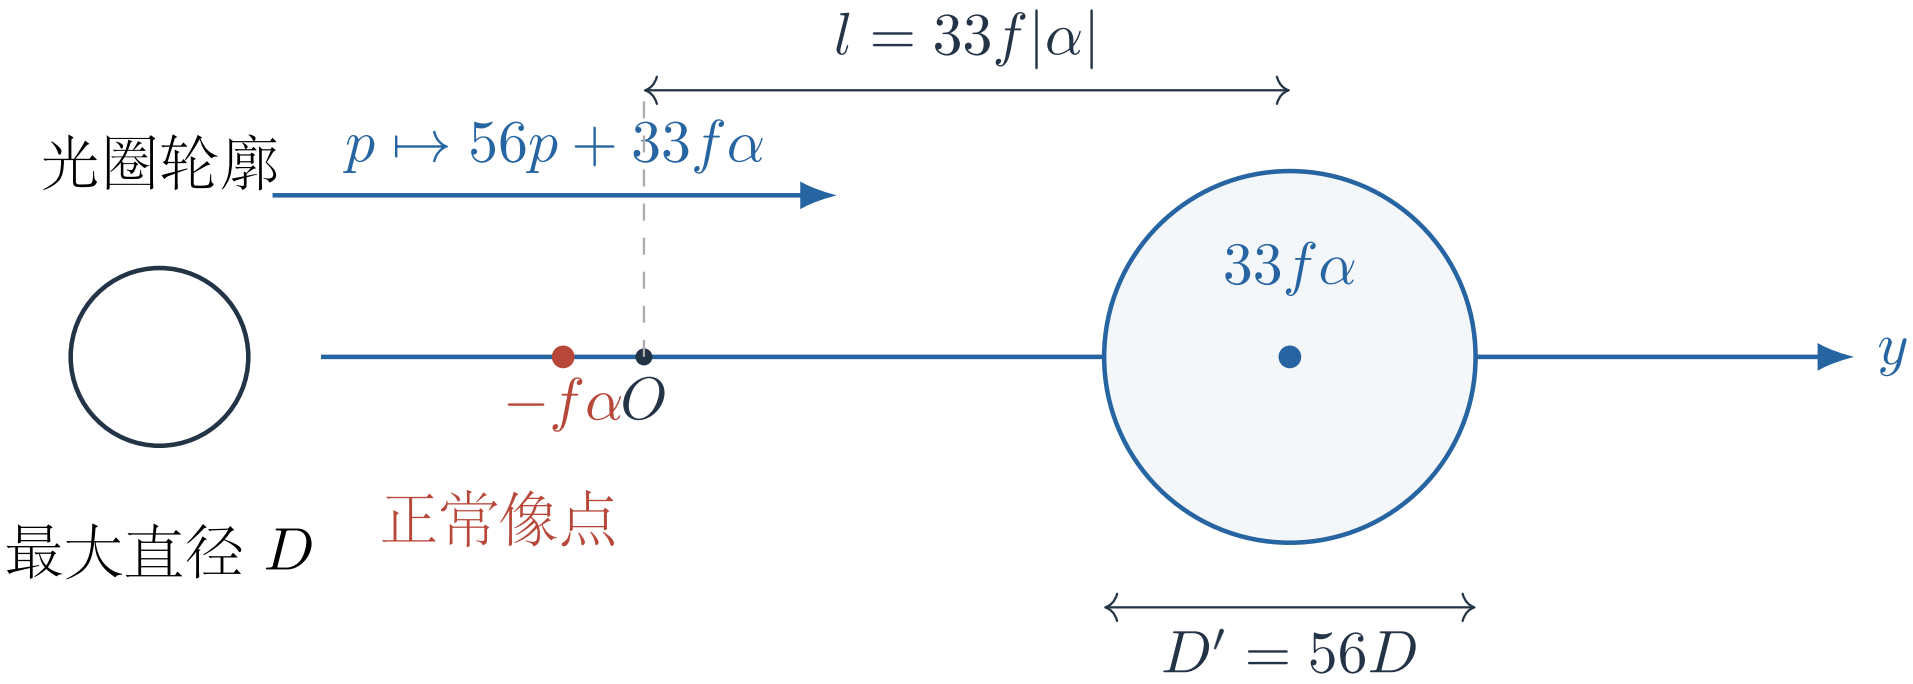


镜面焦距 $f_M = -f/2$



反向传播段已展开；重复标出的 L_1, L_2 是同一对透镜

纵向放大示意；各站高度按同一追迹公式绘制



中心间距为 $34f|\alpha|$；图示不按横向比例
