
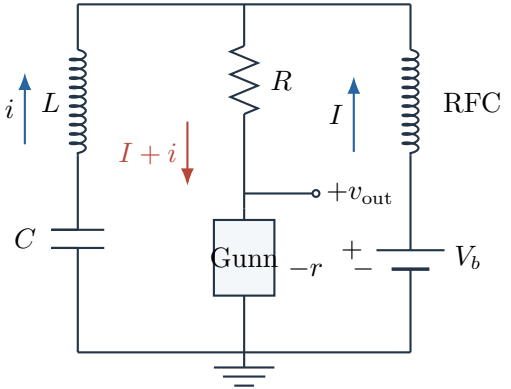
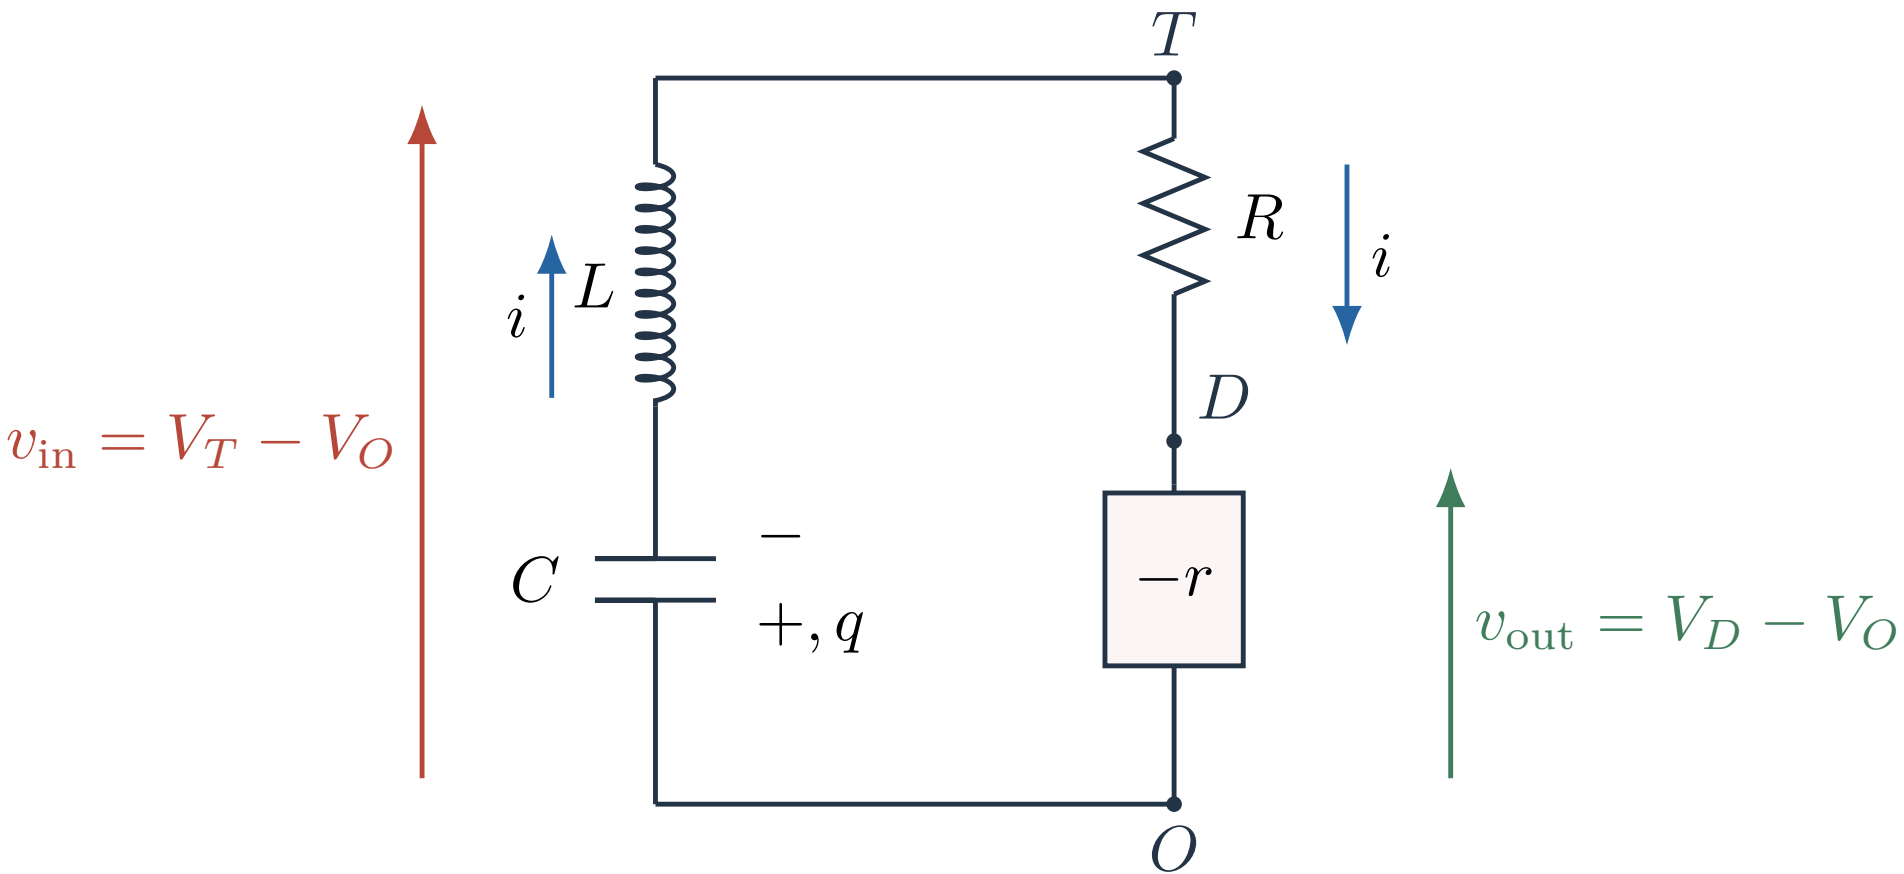
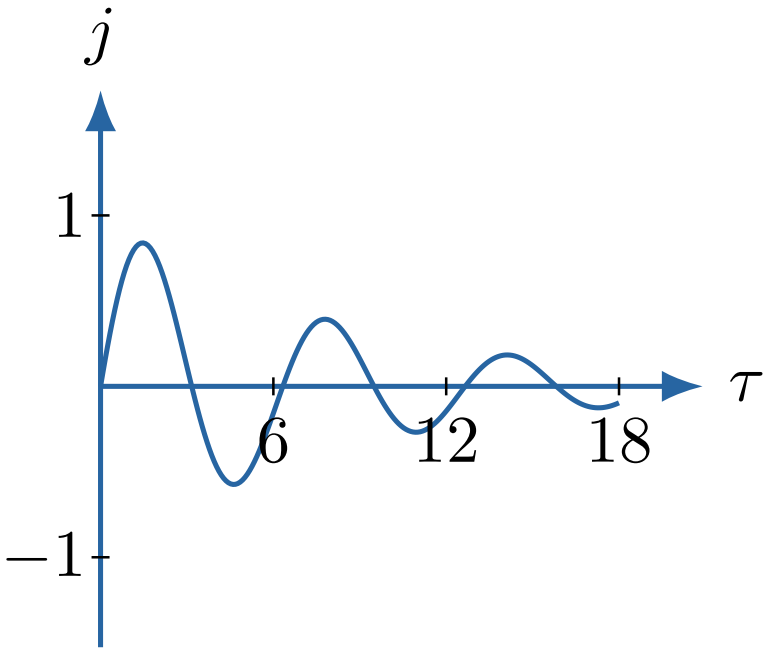
负微分区：$\mathrm{d}V/\mathrm{d}I = -r$



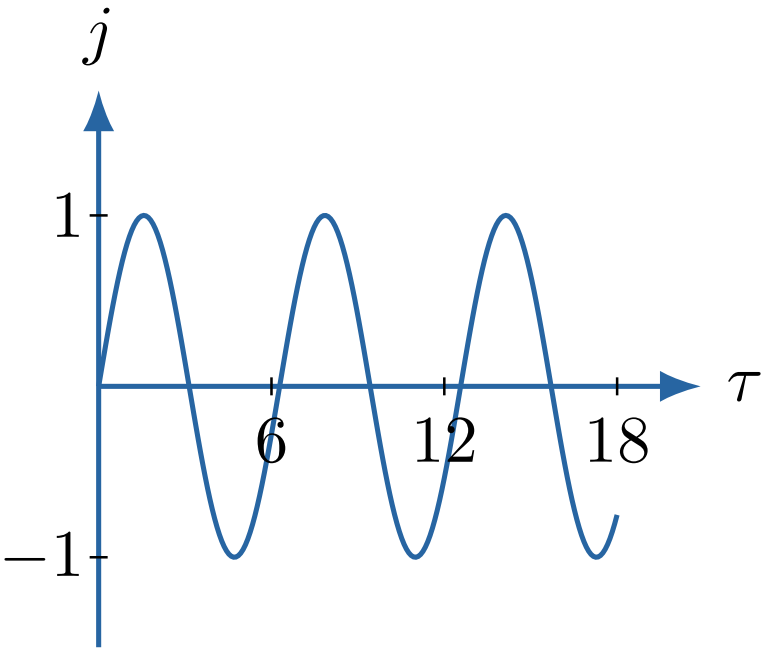


RFC 交流开路；$v_{\text{out}} = -ri$



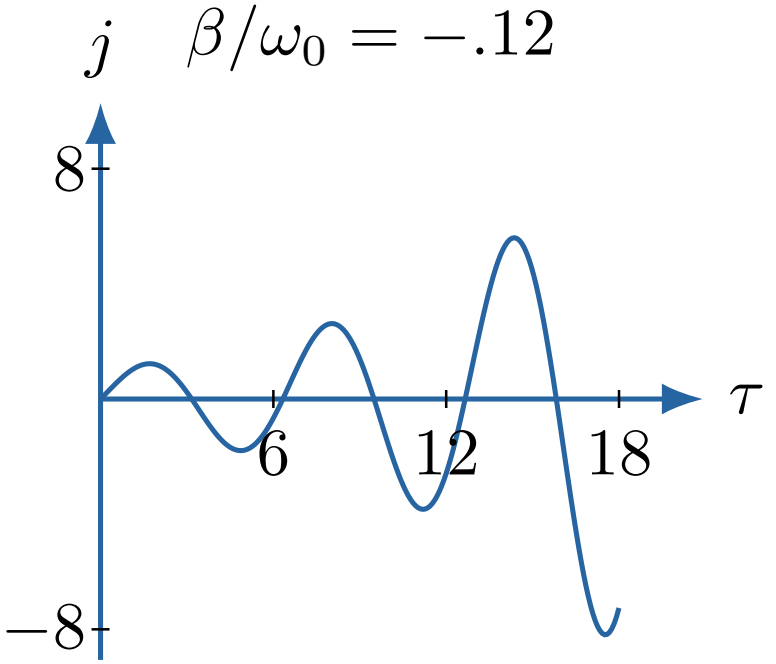
衰减

$\beta/\omega_0 = -.12$



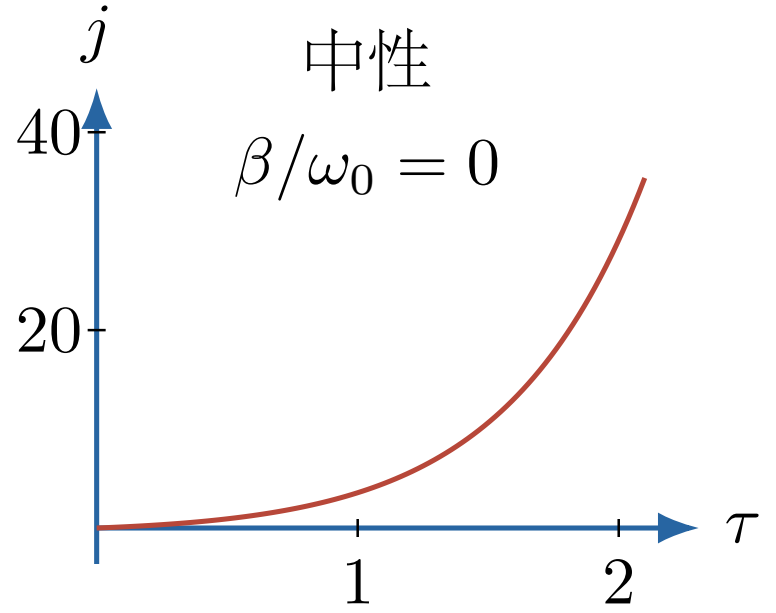
中性

$\beta/\omega_0 = 0$



振荡增长

$\beta/\omega_0 = .12$

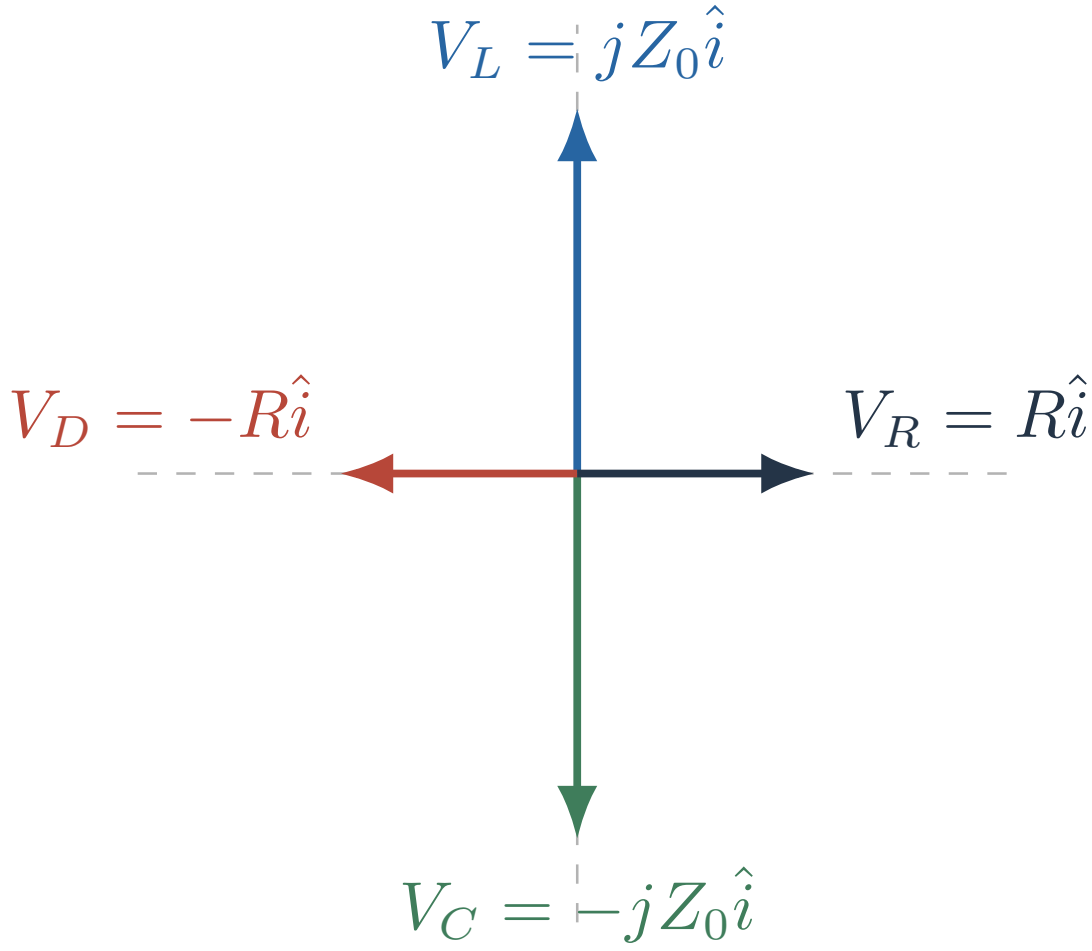


实根非振荡增长

$\beta/\omega_0 = 1.2$

$$\tau = \omega_0 t, \quad j = i/(\alpha/\omega_0), \quad \alpha > 0$$

增长解仅用于小信号条件仍成立的阶段



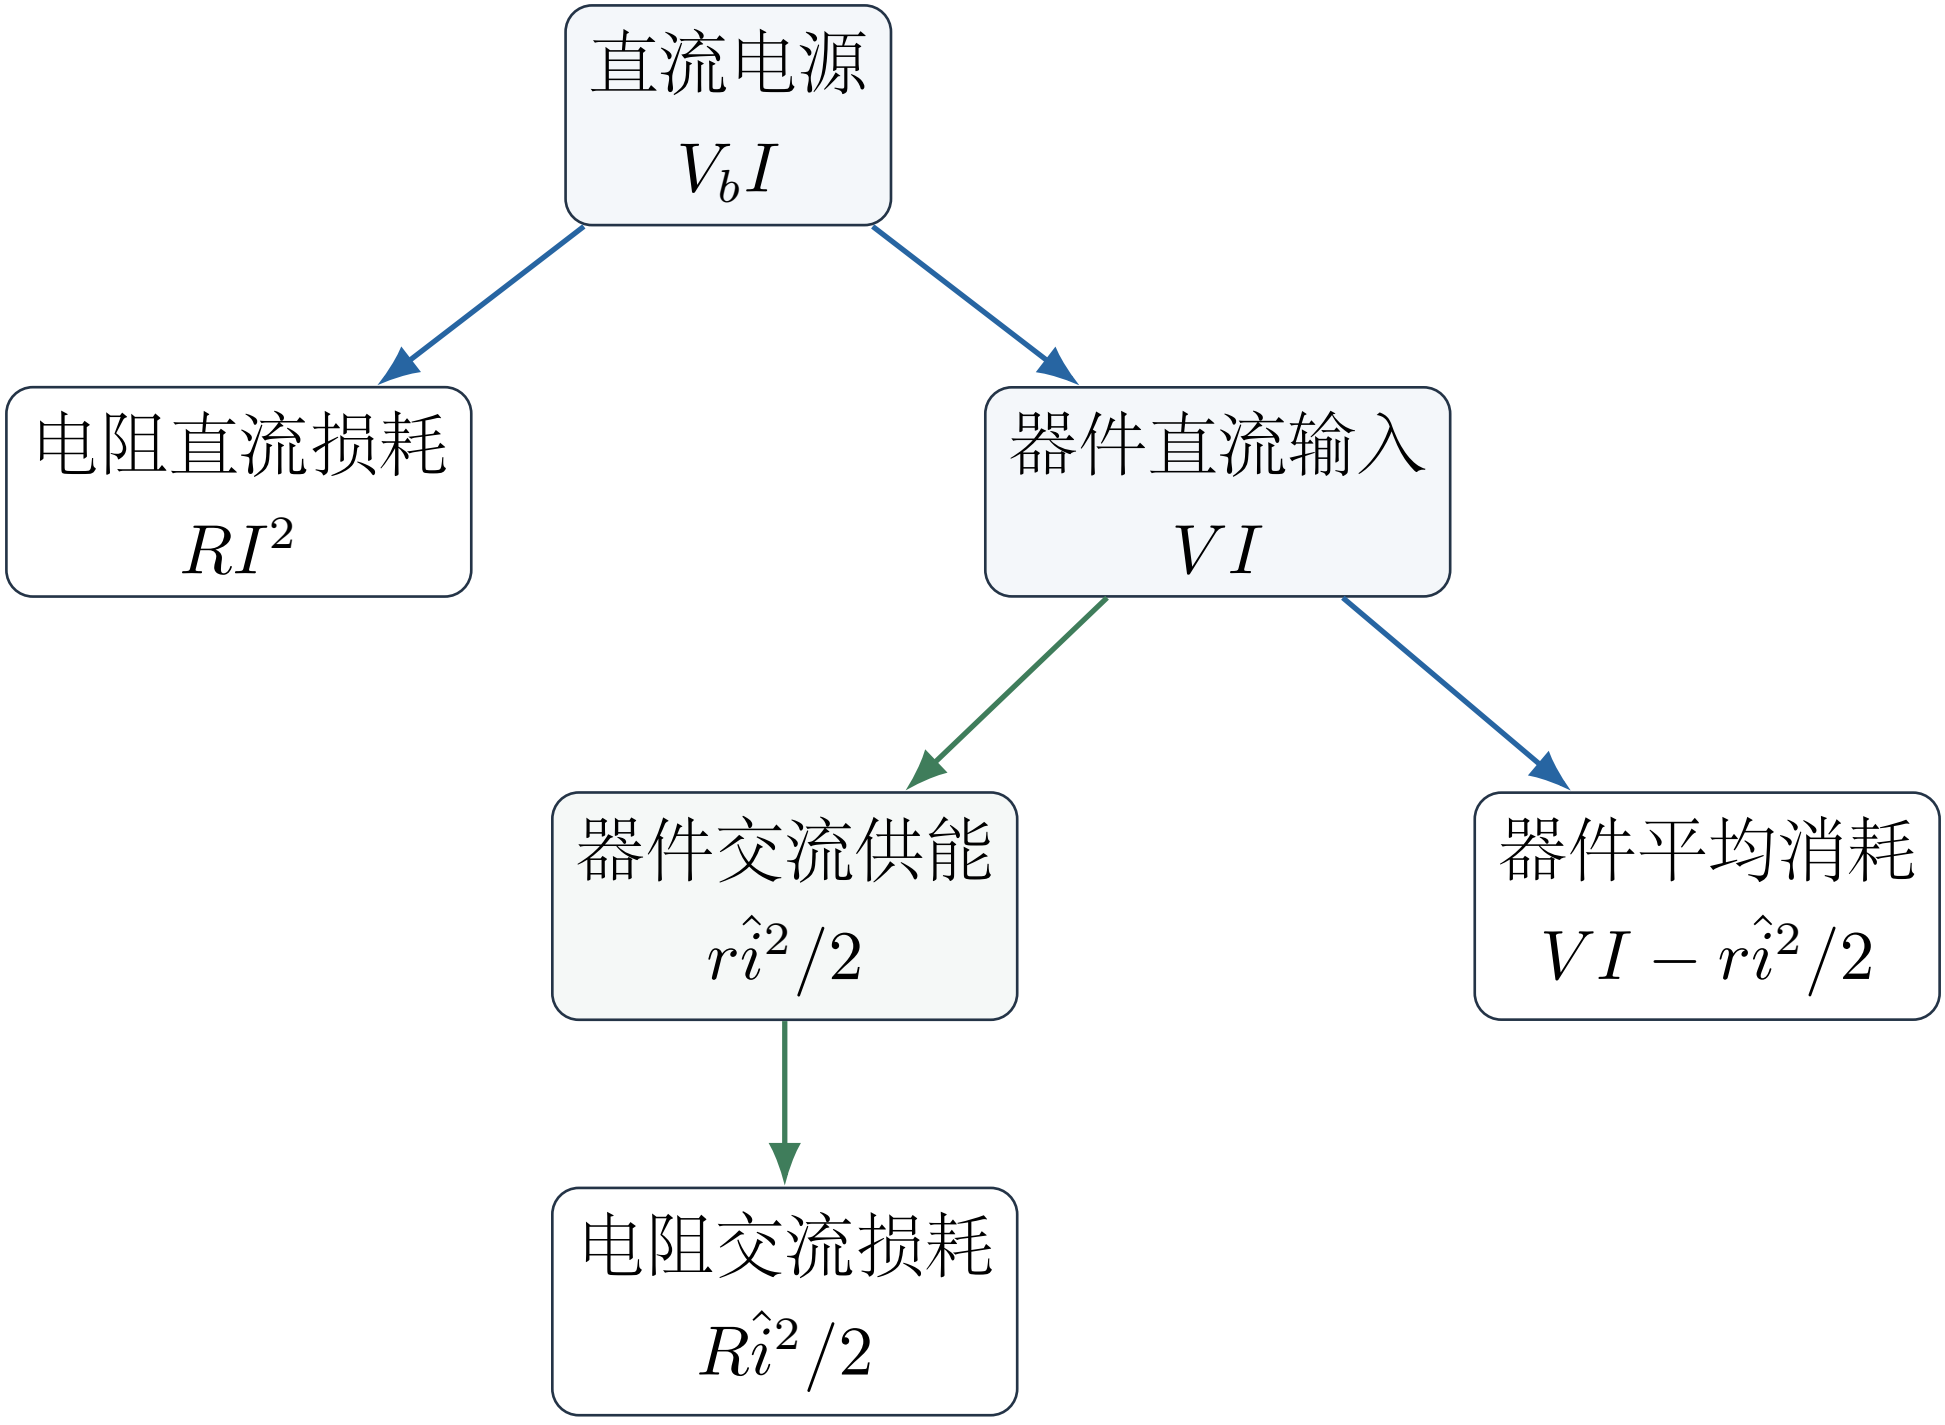
$r = R, \quad \omega = \omega_0$

$V_L + V_C = 0$

$V_R + V_D = 0$

整个 LC 端电压为零

按各元件电流的被动电压约定；$\hat{i}$ 取相位参考



非零线性稳态：$r = R$，交流供能与损耗平衡
